## Revision History

Version	Changes
2.0	Added Version Number to document. Added sections on Default Signal Values for unconnected ports.
2.1	Added PLL primitives
2.2	Corrected SB_CARRY connections to LUT inputs
2.3	Added iCE40 RAM, PLL primitives.
2.4	Added PLL_DS, SB_MIP1_RX_2LANE, SB_TMDS_deserializer primitives.
2.5	Added SB_MAC16 Primitive details.
2.6	Added iCE40LM Hard Macro details. Removed PLL_DS, SB_MIP1, SB_TMDS, SB_MAC16 primitive details.
2.7	Added iCE5LP (iCE40 Ultra) primitive details.
2.8	Removed iCE65 RAM, PLL details.
2.9	Added iCE40UL (iCE40 Ultra Lite) primitive details

# Register Primitives

## ***SB\_DFF***

### **D Flip-Flop**

Data: D is loaded into the flip-flop during a rising clock edge transition.

Inputs			Output
	D	C	Q
	0	↗	0
	1	↗	1
Power on State	X	X	0

Key

- ↗ Rising Edge
- 1 High logic level
- 0 Low logic level
- X Don't care
- ? Unknown

### **HDL use**

This register is inferred during synthesis and can also be explicitly instantiated.

### **Verilog Instantiation**

```
// SB_DFF - D Flip-Flop.
SB_DFF SB_DFF_inst (
    .Q(Q),           // Registered output
    .C(C),           // Clock
    .D(D),           // Data
);

// End of SB_DFF instantiation
```

## VHDL Instantiation

```
-- SB_DFF - D Flip-Flop.

SB_DFF_inst: SB_DFF
  port map (
    Q => Q,          -- Registered Output
    C => C,          -- Clock
    D => D,          -- Data
  );

-- End of SB_DFF instantiation
```

## SB\_DFFE

### D Flip-Flop with Clock Enable

Data D is loaded into the flip-flop when Clock Enable E is high, during a rising clock edge transition.

Inputs			Output
E	D	C	Q
0	X	X	Previous Q
1	0	↗	0
1	1	↗	1
Power on State	X	X	0

#### Key

- ↗ Rising Edge
- 1 High logic level
- 0 Low logic level
- X Don't care
- ? Unknown

### HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

### Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'

Input C: Logic '0'

Input E: Logic '1'

Note that explicitly connecting a logic '1' value to port E will result in a non-optimal implementation, since an extra LUT will be used to generate the logic '1'. It is recommended that the user leave the port E unconnected, or use the corresponding flip-flop without Enable functionality i.e. the DFF primitive.

### Verilog Instantiation

// SB\_DFFE - D Flip-Flop with Clock Enable.

```
SB_DFFE      SB_DFFE_inst (
                .Q(Q),           // Registered Output
                .C(C),           // Clock
                .D(D),           // Data
                .E(E),           // Clock Enable
            );
```

// End of SB\_DFFE instantiation

## VHDL Instantiation

-- SB\_DFFE - D Flip-Flop with Clock Enable.

```
SB_DFFE_inst: SB_DFFE
    port map (
        Q => Q,          -- Registered Output
        C => C,          -- Clock
        D => D,          -- Data
        E => E,          -- Clock Enable
    );
```

-- End of SB\_DFFE instantiation

## SB\_DFFSR

### D Flip-Flop with Synchronous Reset

Data: D is loaded into the flip-flop when Reset R is low during a rising clock edge transition.

Reset: R input is active high, overrides all other inputs and resets the Q output during a rising clock edge.

Inputs			Output
R	D	C	Q
1	X		0
X	X	0	No Change
0	0		0
0	1		1
Power on State	X	X	0

#### Key

Rising Edge  
1 High logic level  
0 Low logic level  
X Don't care  
? Unknown

### HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

### Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'

Input C: Logic '0'

Input R: Logic '0'

### Verilog Instantiation

```
// SB_DFFSR - D Flip-Flop, Reset is synchronous with the rising clock edge
```

```
SB_DFFSR SB_DFFSR_inst (  
    .Q(Q),           // Registered Output  
    .C(C),           // Clock  
    .D(D),           // Data  
    .R(R)            // Synchronous Reset  
);
```

```
// End of SB_DFFSR instantiation
```

## VHDL Instantiation

-- SB\_DFFSR - D Flip-Flop, Reset is synchronous with the rising clock edge

```
SB_DFFSR_inst : SB_DFFSR
  port map (
    Q => Q,          -- Registered Output
    C => C,          -- Clock
    D => D,          -- Data
    R => R           -- Synchronous Reset
  );
```

-- End of SB\_DFFSR instantiation

## SB\_DFFR

### D Flip-Flop with Asynchronous Reset

Data: D is loaded into the flip-flop when R is low during a rising clock edge transition.

Reset: R input is active high, overrides all other inputs and asynchronously resets the Q output.

Inputs			Output
R	D	C	Q
1	X	X	0
0	0	↗	0
0	1	↗	1
Power on State	X	X	0

#### Key

↗ Rising Edge  
1 High logic level  
0 Low logic level  
X Don't care  
? Unknown

### HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

#### Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'

Input C: Logic '0'

Input R: Logic '0'

### Verilog Instantiation

// SB\_DFFR - D Flip-Flop, Reset is asynchronous to the clock.

```
SB_DFFR    SB_DFFR_inst (
    .Q(Q),           // Registered Output
    .C(C),           // Clock
    .D(D),           // Data
    .R(R)            // Asynchronous Reset
);
```

```
// End of SB_DFFR instantiation
```

## **VHDL Instantiation**

```
-- SB_DFFR - D Flip-Flop, Reset is asynchronous to the clock.
```

```
SB_DFFR_inst: SB_DFFR
  port map (
    Q => Q,          -- Registered Output
    C => C,          -- Clock
    D => D,          -- Data
    R => R            -- Asynchronous Reset
  );
```

```
-- End of SB_DFFR instantiation
```

## SB\_DFFSS

### D Flip-Flop with Synchronous Set

Data: D is loaded into the flip-flop when the Synchronous Set S is low during a rising clock edge transition.

Set: S input is active high, overrides all other inputs and synchronously sets the Q output.

Inputs			Output
S	D	C	Q
1	X		1
0	0		0
0	1		1
Power on State	X	X	0

#### Key

Rising Edge  
1 High logic level  
0 Low logic level  
X Don't care  
? Unknown

### HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

### Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'

Input C: Logic '0'

Input S: Logic '0'

### Verilog Instantiation

```
// SB_DFFSS - D Flip-Flop, Set is synchronous with the rising clock edge,
```

```
SB_DFFSS SB_DFFSS_inst (  
    .Q(Q),           // Registered output  
    .C(C),           // Clock  
    .D(D),           // Data  
    .S(S)            // Synchronous Set  
);
```

```
// End of SB_DFFSS instantiation
```

## VHDL Instantiation

-- SB\_DFFSS - D Flip-Flop, Set is synchronous with the rising clock edge

```
SB_DFFSS_inst  SB_DFFSS
  port map (
    Q => Q,          -- Registered Output
    C => C,          -- Clock
    D => D,          -- Data
    S => S           -- Synchronous Set
  );
```

-- End of SB\_DFFSS instantiation

## SB\_DFFS

### D Flip-Flop with Asynchronous Set

Data: D is loaded into the flip-flop when S is low during a rising clock edge transition.

Set: S input is active high, and it overrides all other inputs and asynchronously sets the Q output.

Inputs			Output
S	D	C	Q
1	X	X	1
0	0	↗	0
0	1	↗	1
Power on State	X	X	0

#### Key

↗ Rising Edge  
1 High logic level  
0 Low logic level  
X Don't care  
? Unknown

### HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

### Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'

Input C: Logic '0'

Input S: Logic '0'

### Verilog Instantiation

// SB\_DFFS - D Flip-Flop, Set is asynchronous to the rising clock edge

```
SB_DFFS    SB_DFFS_inst (
    .Q(Q),           // Registered Output
    .C(C),           // Clock
    .D(D),           // Data
    .S(S)            // Asynchronous Set
);
```

// End of SB\_DFFS instantiation

## VHDL Instantiation

-- SB\_DFFS - D Flip-Flop, Set is asynchronous to the rising clock edge

```
SB_DFFS_inst: SB_DFFS
  port map (
    Q => Q,          -- Registered Output
    C => C,          -- Clock
    D => D,          -- Data
    S => S           -- Asynchronous Set
  );

-- End of SB_DFFS instantiation
```

## SB\_DFFESR

### D Flip-Flop with Clock Enable and Synchronous Reset

Data: D is loaded into the flip-flop when Reset R is low and Clock Enable E is high during a rising clock edge transition.

Reset: R, when asserted with Clock Enable E high, synchronously resets the Q output during a rising clock edge.

Inputs				Output
R	E	D	C	Q
1	1	X	↗	0
X	0	X	X	Previous Q
0	1	0	↗	0
0	1	1	↗	1
Power on State	X	X	X	0

#### Key

↗ Rising Edge  
1 High logic level  
0 Low logic level  
X Don't care  
? Unknown

### HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

### Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'

Input C: Logic '0'

Input R: Logic '0'

Input E: Logic '1'

Note that explicitly connecting a Logic '1' value to port E will result in a non-optimal implementation, since an extra LUT will be used to generate the Logic '1'. If the user's intention is to keep the FF always enabled, it is recommended that either port E be left unconnected, or the corresponding FF without a Clock Enable port be used.

## Verilog Instantiation

```
// SB_DFFESR - D Flip-Flop, Reset is synchronous with rising clock edge
// Clock Enable.
```

```
SB_DFFESR SB_DFFESR_inst (
    .Q(Q),           // Registered Output
    .C(C),           // Clock
    .E(E),           // Clock Enable
    .D(D),           // Data
    .R(R)            // Synchronous Reset
);
```

```
// End of SB_DFFESR instantiation
```

## VHDL Instantiation

```
-- SB_DFFESR - D Flip-Flop, Reset is synchronous with rising clock edge
-- Clock Enable.
```

```
SB_DFFESR_inst: SB_DFFESR
    port map (
        Q => Q,       -- Registered Output
        C => C,       -- Clock
        E => E,       -- Clock Enable
        D => D,       -- Data
        R => R        -- Synchronous Reset
    );
```

```
-- End of SB_DFFESR instantiation
```

## SB\_DFFER

### D Flip-Flop with Clock Enable and Asynchronous Reset

Data: D is loaded into the flip-flop when Reset R is low and Clock Enable E is high during a rising clock edge transition.

Reset: R input is active high, overrides all other inputs and asynchronously resets the Q output.

Inputs				Output
R	E	D	C	Q
1	X	X	X	0
0	0	X	X	Previous Q
0	1	0	↗	0
0	1	1	↗	1
Power on State	X	X	X	0

Key

↗ Rising Edge  
1 High logic level  
0 Low logic level  
X Don't care  
? Unknown

### HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

### Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'

Input C: Logic '0'

Input R: Logic '0'

Input E: Logic '1'

Note that explicitly connecting a Logic '1' value to port E will result in a non-optimal implementation, since an extra LUT will be used to generate the Logic '1'. If the user's intention is to keep the FF always enabled, it is recommended that either port E be left unconnected, or the corresponding FF primitive without a Clock Enable port be used.

## Verilog Instantiation

// SB\_DFFER - D Flip-Flop, Reset is asynchronously on rising clock edge with Clock Enable.

```
SB_DFFER SB_DFFER_inst (  
    .Q(Q),           // Registered Output  
    .C(C),           // Clock  
    .E(E),           // Clock Enable  
    .D(D),           // Data  
    .R(R),           // Asynchronously Reset  
);
```

// End of SB\_DFFER instantiation

## VHDL Instantiation

-- SB\_DFFER - D Flip-Flop, Reset is asynchronously  
-- on rising clock edge with Clock Enable.

```
SB_DFFER_inst : SB_DFFER  
    port map (  
        Q => Q,       -- Registered Output  
        C => C,       -- Clock  
        E => E,       -- Clock Enable  
        D => D,       -- Data  
        R => R        -- Asynchronously Reset  
    );
```

-- End of SB\_DFFER instantiation

## SB\_DFFESS

### D Flip-Flop with Clock Enable and Synchronous Set

Data: D is loaded into the flip-flop when S is low and E is high during a rising clock edge transition.

Set: Asserting S when Clock Enable E is high, synchronously sets the Q output.

Inputs				Output
S	E	D	C	Q
1	1	X	↗	1
0	0	X	X	Previous Q
0	1	0	↗	0
0	1	1	↗	1
Power on State	X	X	X	0

Key

↗ Rising Edge  
1 High logic level  
0 Low logic level  
X Don't care  
? Unknown

### HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

### Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'

Input C: Logic '0'

Input R: Logic '0'

Input S: Logic '0'

### Verilog Instantiation

// SB\_DFFESS - D Flip-Flop, Set is synchronous with rising clock edge and Clock Enable.

```
SB_DFFESS SB_DFFESS_inst (  
    .Q(Q),           // Registered Output  
    .C(C),           // Clock  
    .E(E),           // Clock Enable  
    .D(D),           // Data  
    .S(S)            // Synchronously Set  
);
```

```
// End of SB_DFFESS instantiation
```

## **VHDL Instantiation**

```
-- SB_DFFESS - D Flip-Flop, Set is synchronous with rising clock edge and Clock Enable.
```

```
SB_DFFESS_inst : SB_DFFESS
  port map (
    Q => Q,          -- Registered Output
    C => C,          -- Clock
    E => E,          -- Clock Enable
    D => D,          -- Data
    S => S           -- Synchronously Set
  );
```

```
-- End of SB_DFFESS instantiation
```

## SB\_DFFES

### D Flip-Flop with Clock Enable and Asynchronous Set

Data: D is loaded into the flip-flop when S is low and E is high during a rising clock edge transition.

Set: S input is active high, overrides all other inputs and asynchronously sets the Q output.

Inputs				Output
S	E	D	CLK	Q
1	X	X	X	1
0	0	X	X	Previous <b>Q</b>
0	1	0	↗	0
0	1	1	↗	1
Power on State	X	X	X	0

Key

↗ Rising Edge  
1 High logic level  
0 Low logic level  
X Don't care  
? Unknown

### HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

### Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'

Input C: Logic '0'

Input S: Logic '0'

Input E: Logic '1'

### Verilog Instantiation

// SB\_DFFES - D Flip-Flop, Set is asynchronous on rising clock edge with Clock Enable.

```
SB_DFFES SB_DFFES_inst (  
    .Q(Q),           // Registered Output  
    .C(C),           // Clock  
    .E(E),           // Clock Enable  
    .D(D),           // Data  
    .S(S)            // Asynchronously Set  
);
```

```
// End of SB_DFFES instantiation
```

## **VHDL Instantiation**

```
-- SB_DFFES - D Flip-Flop, Set is asynchronous on rising clock edge with Clock Enable.
```

```
SB_DFFES_inst : SB_DFFES
  port map (
    Q => Q,          -- Registered Output
    C => C,          -- Clock
    E => E,          -- Clock Enable
    D => D,          -- Data
    S => S           -- Asynchronously Set
  );
```

```
-- End of SB_DFFES instantiation
```

## SB\_DFFN

### D Flip-Flop – Negative Edge Clock

Data: D is loaded into the flip-flop during the falling clock edge transition.

Inputs			Output
	D	C	Q
	0		0
	1		1
Power on State	X	X	0

Key

-  Falling Edge
- 1 High logic level
- 0 Low logic level
- X Don't care
- ? Unknown

### HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

### Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'

Input C: Logic '0'

### Verilog Instantiation

```
// SB_DFFN - D Flip-Flop – Negative Edge Clock.
```

```
SB_DFFN SB_DFFN_inst (  
    .Q(Q),           // Registered Output  
    .C(C),           // Clock  
    .D(D),           // Data  
);
```

```
// End of SB_DFFN instantiation

## VHDL Instantiation

-- SB\_DFFN - D Flip-Flop – Negative Edge Clock.

```
SB_DFFN_inst : SB_DFFN
  port map (
    Q => Q,          -- Registered Output
    C => C,          -- Clock
    D => D,          -- Data
  );

-- End of SB_DFFN instantiation
```

## SB\_DFFNE

### D Flip-Flop – Negative Edge Clock and Clock Enable

Data: D is loaded into the flip-flop when E is high, during the falling clock edge transition.

Inputs			Output
E	D	C	Q
0	X	X	0
1	0	↘	0
1	1	↘	1
Power on State	X	X	0

#### Key

↘ Falling Edge  
1 High logic level  
0 Low logic level  
X Don't care  
? Unknown

### HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

### Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'

Input C: Logic '0'

Input E: Logic '1'

Note that explicitly connecting a Logic '1' value to port E will result in a non-optimal implementation, since an extra LUT will be used to generate the Logic '1'. If the user's intention is to keep the FF always enabled, it is recommended that either port E be left unconnected, or the corresponding FF without a Clock Enable port be used.

### Verilog Instantiation

// SB\_DFFNE - D Flip-Flop – Negative Edge Clock and Clock Enable.

```
SB_DFFNE SB_DFFNE_inst (  
    .Q(Q),           // Registered Output  
    .C(C),           // Clock  
    .D(D),           // Data  
    .E(E),           // Clock Enable  
);
```

```
// End of SB_DFFNE instantiation
```

## **VHDL Instantiation**

```
-- SB_DFFNE - D Flip-Flop – Negative Edge Clock and Clock Enable.
```

```
SB_DFFNE_inst : SB_DFFNE
  port map (
    Q => Q,          -- Registered Output
    C => C,          -- Clock
    D => D,          -- Data
    E => E,          -- Clock Enable
  );
```

```
-- End of SB_DFFNE instantiation
```

## SB\_DFFNSR

### D Flip-Flop – Negative Edge Clock with Synchronous Reset

Data: D is loaded into the flip-flop when R is low during the falling clock edge transition.

Reset: R input is active high, overrides all other inputs and resets the Q output during the falling clock edge transition.

Inputs			Output
R	D	C	Q
1	X		0
X	X		No Change
0	0		0
0	1		1
Power on State	X	X	0

#### Key

Falling Edge  
1 High logic level  
0 Low logic level  
X Don't care  
? Unknown

### HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

### Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'

Input C: Logic '0'

Input R: Logic '0'

### Verilog Instantiation

// SB\_DFFNSR - D Flip-Flop – Negative Edge Clock, Reset is synchronous with the falling clock edge

```
SB_DFFNSR    SB_DFFNSR_inst (
    .Q(Q),           // Registered Output
    .C(C),           // Clock
    .D(D),           // Data
    .R(R),           // Synchronous Reset
);
```

```
// End of SB_DFFNSR instantiation
```

## **VHDL Instantiation**

```
-- SB_DFFNSR - D Flip-Flop – Negative Edge Clock, Reset is synchronous with the falling clock edge
```

```
SB_DFFNSR_inst: SB_DFFNSR
  port map (
    Q => Q,          -- Registered Output
    C => C,          -- Clock
    D => D,          -- Data
    R => R           -- Synchronous Reset
  );
```

```
-- End of SB_DFFNSR instantiation
```

## SB\_DFFNR

### D Flip-Flop – Negative Edge Clock with Asynchronous Reset

Data: D is loaded into the flip-flop when R is low during the falling clock edge transition.

Reset: R input is active high, overrides all other inputs and asynchronously resets the Q output.

Inputs			Output
R	D	CLK	Q
1	X	X	0
0	0	↘	0
0	1	↘	1
Power on State	X	X	0

#### Key

↘ Falling Edge

0 Low logic level  
X Don't care  
? Unknown

### HDL Usage

This register is inferred during synthesis and can also be explicitly instantiated.

### Default Signal Values

The iCEcube2 software assigns the following signal values to unconnected input ports:

Input D: Logic '0'

Input C: Logic '0'

Input R: Logic '0'

### Verilog Instantiation

// SB\_DFFNR - D Flip-Flop – Negative Edge Clock, Reset is asynchronous to the clock.

```
SB_DFFNR SB_DFFNR_inst (  
    .Q(Q),           // Registered Output  
    .C(C),           // Clock  
    .D(D),           // Data  
    .R(R),           // Asynchronously Reset  
);
```

// End of SB\_DFFNR instantiation

## VHDL Instantiation

-- SB\_DFFNR - D Flip-Flop – Negative Edge Clock, Reset is asynchronous to the clock.

```
SB_DFFNR_inst : SB_DFFNR
  port map (
    Q => Q,          -- Registered Output
    C => C,          -- Clock
    D => D,          -- Data
    R => R           -- Asynchronously Reset
  );

-- End of SB_DFFNR instantiation
```

## SB\_DFFNSS

### D Flip-Flop – Negative Edge Clock with Synchronous Set

Data: D is loaded into the flip-flop when S is low during the falling clock edge transition.

Set: S input is active high, overrides all other inputs and synchronously sets the Q output.

Inputs			Output
S	D	C	Q
1	X		1
0	0		0
0	1		1
Power on State	X	X	0

1	1	0	1	LUT_INIT[13]
1	1	1	0	LUT_INIT[14]
1	1	1	1	LUT_INIT[15]

### HDL Usage

This primitive is inferred during synthesis and can also be explicitly instantiated.

### Default Signal Values

The iCEcube2 software assigns logic value '0' to unconnected input ports.

## Verilog Instantiation

```
// SB_LUT4 : 4-input Look-Up Table

SB_LUT4      SB_LUT4_inst (
    .O (O),           // output
    .I0 (I0),         // data input 0
    .I1 (I1),         // data input 1
    .I2 (I2),         // data input 2
    .I3 (I3),         // data input 3
);
defparam SB_LUT4_inst.LUT_INIT=16'hxxxx;
           //LUT state initialization parameter, 16 bits.

//End of SB_LUT4 instantiation
```

## VHDL Instantiation

```
-- SB_LUT4 : 4-input Look-Up Table

SB_LUT4_inst: SB_LUT4
    generic map(
        LUT_INIT => x"0001"    -- LUT state initialization parameter, 16 bits
    )
    port map (
        I0 => I0,
        I1 => I1,
        I2 => I2,
        I3 => I3,
        O  => O
    );
```

## SB\_CARRY

### Carry Logic

The dedicated Carry Logic within each Logic Cell primarily accelerates and improves the efficiency of arithmetic logic such as adders, accumulators, subtractors, incrementers, decrementers, counters, ALUs, and comparators. The Carry Logic also supports a limited number of wide combinational logic functions.

The figure below illustrates the Carry Logic structure within a Logic Cell. The Carry Logic shares inputs with the associated Look-Up Table (LUT). The I1 and I2 inputs of the LUT directly feed the Carry Logic.. The carry input from the previous adjacent Logic Cell optionally provides an alternate input to the LUT4 function, supplanting the I3 input.

### Carry Logic Structure within a Logic Cell

Inputs			Output
I0	I1	CI	CO
0	0	X	0
0	X	0	0
X	1	1	1
X	0	0	0
1	X	1	1
1	1	X	1

### HDL Usage

This primitive is inferred during synthesis and can also be explicitly instantiated.

### Default Signal Values

The iCEcube2 software assigns logic value '0' to unconnected input ports.

## Verilog Instantiation

```
SB_CARRY my_carry_inst (  
    .CO(CO),  
    .I0(I0),  
    .I1(I1),  
    .CI(CI));
```

## VHDL Instantiation

```
my_carry_inst : SB_CARRY  
    port map (  
        CO => CO,  
        CI => CI,  
        I0 => I0,  
        I1 => I1  
    );
```

# Block RAM Primitives

The iCE architecture supports dual ported synchronous RAM, with 4096 bits, and a fixed 16 bit data-width. The block is arranged as 256 x 16 bit words. The RAM block may be configured to be used as a RAM with data between 1-16 bits.

## iCE40 Block RAM

Each iCE40 device includes multiple high-speed synchronous RAM blocks, each 4Kbit in size. The RAM block has separate write and read ports, each with independent control signals. Each RAM block can be configured into a RAM block of size 256x16, 512x8, 1024x4 or 2048x2. The data contents of the RAM block are optionally pre-loaded during ICE device configuration.

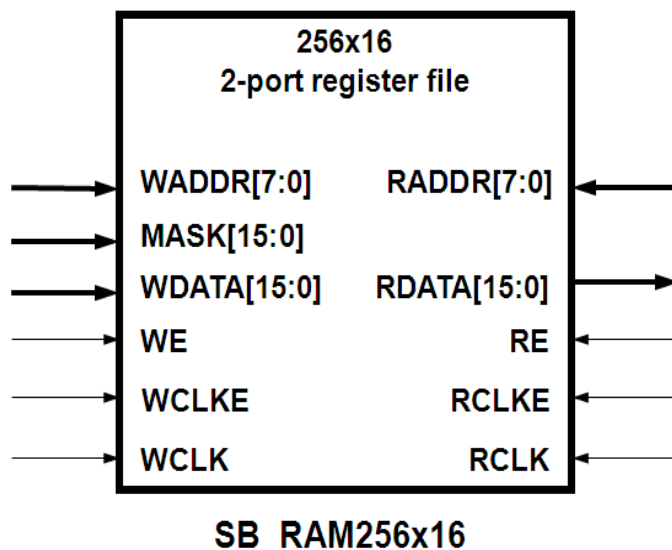

The following table lists the supported dual port synchronous RAM configurations, each of 4Kbits in size. The RAM blocks can be directly instantiated in the top module and taken through iCube2 flow.

Block RAM Configuration	Block RAM Size	WADDR Port Size (Bits)	WDATA Port Size (Bits)	RADDR Port Size (Bits)	RDATA Port Size (Bits)	MASK Port Size (Bits)
SB_RAM256x16 SB_RAM256x16NR SB_RAM256x16NW SB_RAM256x16NRNW	256x16 (4K)	8 [7:0]	16 [15:0]	8 [7:0]	16 [15:0]	16 [15:0]
SB_RAM512x8 SB_RAM512x8NR SB_RAM512x8NW SB_RAM512x8NRNW	512x8 (4K)	9 [8:0]	8 [7:0]	8 [8:0]	8 [7:0]	No Mask Port
SB_RAM1024x4 SB_RAM1024x4NR SB_RAM1024x4NW SB_RAM1024x4NRNW	1024x4 (4K)	10 [9:0]	4 [3:0]	10 [9:0]	4 [3:0]	No Mask Port
SB_RAM2048x2 SB_RAM2048x2NR SB_RAM2048x2NW SB_RAM2048x2NRNW	2048x2 (4K)	11 [10:0]	2 [1:0]	10 [9:0]	2 [1:0]	No Mask Port

The Lattice Technologies convention for the iCE40 RAM primitives with negedge Read or Write clock is that the base primitive name is post fixed with N and R or W according to the clock that is affected, as displayed in the table below for 256x16 RAM block configuration.

RAM Primitive Name	Description
SB_RAM256x16	Posedge Read clock, Posedge Write clock
SB_RAM4256x16NR	Negedge Read clock, Posedge Write clock
SB_RAM256x16NW	Posedge Read clock, Negedge Write clock
SB_RAM256x16NRNW	Negedge Read clock, Negedge Write clock

## SB\_RAM40\_4K

SB\_RAM40\_4K is the basic physical RAM primitive which can be instantiated and configured to different depth and dataports. The SB\_RAM40\_4K block has a size of 4K bits with separate write and read ports, each with independent control signals. By default, input and output data is 16 bits wide, although the data width is configurable using the READ\_MODE and WRITE\_MODE parameters. The data contents of the SB\_RAM40\_4K block are optionally pre-loaded during ICE device configuration.

### SB\_RAM40\_4K Naming Convention Rules

RAM Primitive Name	Description
SB_RAM40_4K	Posedge Read clock, Posedge Write clock
SB_RAM40_4KNR	Negedge Read clock, Posedge Write clock
SB_RAM40_4KNW	Posedge Read clock, Negedge Write clock
SB_RAM40_4KNRNW	Negedge Read clock, Negedge Write clock

The following table lists the signals for both ports.

SB_RAM40_4K RAM Port Signals		
Signal Name	Direction	Description
WDATA[15:0]	Input	Write Data input
MASK[15:0]*	Input	Bit-line Write Enable input, active low. Applicable only when WRITE_MODE parameter is set to 0.
WADDR[7:0]	Input	Write Address input. Selects up to 256 possible locations
WE	Input	Write Enable input, active high
WCLK	Input	Write Clock input, rising-edge active
WCLKE	Input	Write Clock Enable input
RDATA[15:0]	Output	Read Data output
RADDR[7:0]	Input	Read Address input. Selects one of 256 possible locations
RE	Input	Read Enable input, active high
RCLK	Input	Read Clock input, rising-edge active
RCLKE	Input	Read Clock Enable input

Parameter Name	Description	Parameter Value	Configuration
INIT_0, ... ...,INIT_F	RAM Initialization Data. Passed using 16 parameter strings, each comprising 256 bits. (16x256=4096 total bits)	INIT_0 to INIT_F	Initialize the RAM with predefined value
WRITE_MODE	Sets the RAM block write port configuration	0	256x16
		1	512x8
		2	1024x4
		3	2048x2
READ_MODE	Sets the RAM block read port configuration	0	256x16
		1	512x8
		2	1024x4
		3	2048x2

);
```

# IO Primitives

## SB\_IO

The SB\_IO block contains five registers. The following figure and Verilog template illustrate the complete user accessible logic diagram, and its Verilog instantiation.

### Default Signal Values

The iCEcube2 software assigns the logic '0' value to all unconnected input ports except for CLOCK\_ENABLE.

Note that explicitly connecting a logic '1' value to port CLOCK\_ENABLE will result in a non-optimal implementation, since an extra LUT will be used to generate the Logic '1'. If the user's intention is to keep the Input and Output registers always enabled, it is recommended that port CLOCK\_ENABLE be left unconnected.

## Input and Output Pin Function Tables

Input and Output functions are independently selectable via PIN\_TYPE [1:0] and PIN\_TYPE [5:2] parameter settings respectively. Specific IO functions are defined by the combination of both attributes. This means that the complete number of combinations is 64, although some combinations are not valid and not defined below.

Note that the selection of IO Standards such as SSTL and LVCMOS are not defined by these tables.

Input Pin Function Table				
#	Pin Function Mnemonic	PIN_TYPE[1:0]		Functional Description of Package Pin Input Operation
1	PIN_INPUT	0	1	Simple input pin (D_IN_0)
2	PIN_INPUT_LATCH	1	1	Disables internal data changes on the physical input pin by latching the value.
3	PIN_INPUT_REGISTERED	0	0	Input data is registered in input cell
4	PIN_INPUT_REGISTERED_LATCH	1	0	Disables internal data changes on the physical input pin by latching the value on the input register
5	PIN_INPUT_DDR	0	0	Input 'DDR' data is clocked out on rising and falling clock edges. Use the D_IN_0 and D_IN_1 pins for DDR operation.

Output Pin Function table						
#	Pin Function Mnemonic	PIN_TYPE[5:2]				Functional Description of Package Pin Output Operation
1	PIN_NO_OUTPUT	0	0	0	0	Disables the output function
2	PIN_OUTPUT	0	1	1	0	Simple output pin, (no enable)
3	PIN_OUTPUT_TRISTATE	1	0	1	0	The output pin may be tristated using the enable
4	PIN_OUTPUT_ENABLE_REGISTERED	1	1	1	0	The output pin may be tristated using a registered enable signal
5	PIN_OUTPUT_REGISTERED	0	1	0	1	Output registered, (no enable)
6	PIN_OUTPUT_REGISTERED_ENABLE	1	0	0	1	Output registered with enable (enable is not registered)
7	PIN_OUTPUT_REGISTERED_ENABLE_REGISTERED	1	1	0	1	Output registered and enable registered
8	PIN_OUTPUT_DDR	0	1	0	0	Output 'DDR' data is clocked out on rising and falling clock edges
9	PIN_OUTPUT_DDR_ENABLE	1	0	0	0	Output data is clocked out on rising and falling clock edges
10	PIN_OUTPUT_DDR_ENABLE_REGISTERED	1	1	0	0	Output 'DDR' data with registered enable signal
11	PIN_OUTPUT_REGISTERED_INVERTED	0	1	1	1	Output registered signal is inverted
12	PIN_OUTPUT_REGISTERED_ENABLE_INVERTED	1	0	1	1	Output signal is registered and inverted, (no enable function)
13	PIN_OUTPUT_REGISTERED_ENABLE_REGISTERED_INVERTED	1	1	1	1	Output signal is registered and inverted, the enable/tristate control is registered.

## Syntax Verilog Use

**Output Pin Function** is the bit vector associated with **PIN\_TYPE [5:2]** and **Input Pin Function** is the bit vector associated with **PIN\_TYPE [1:0]**, resulting in a 6 bit value **PIN\_TYPE [5:0]**

```
defparam my_generic_IO.PIN_TYPE = 6'b{Output Pin Function, Input Pin Function};
```

## DDR IO Configuration

The following setting configures the SB\_IO into a DDR IO.

```
defparam my_DDR_IO.PIN_TYPE = 6'b100000;  
  
// PIN_TYPE [5:2] = 1000  
// PIN_TYPE [1:0] = 00
```

This creates a DDR IO pin whereby the input data is clocked in on both the rising and falling input clock edges.

The output 'DDR' data is clocked out on rising and falling output clock edges, and the output may be tri-stated, using the output enable port of the SB\_IO.

## High Drive SB\_IO

IO's in iCE40/iCE40LM device can be configured with different drive strengths to increase the IO output current. To configure an SB\_IO with specific drive value, the user needs to specify the "DRIVE\_STRENGTH" synthesis attribute on the SB\_IO instance and the IO should be configured as output-only registered IO.

### Synthesis Attribute Syntax:

```
/* synthesis DRIVE_STRENGTH = <Drive value> */
```

#### Drive Value:

Drive Strength Value	Description.
x1	Default drive strength. No replication of SB_IO.
x2	Increase default drive strength by 2. SB_IO replicated once.
x3	Increase default drive strength by 3. SB_IO replicated twice.

**Note:** High drive SB\_IO is available only in selected ICE40/ICE40LM packages. Refer to Chapter 12 in iCEcube2\_userguide for the list of supported device packages.

## Pull Up Resistor Configuration.

For iCE40UL device, user can configure the internal pull up resistor strength of an IO to a predefined resistor value via attribute settings. By default, all the IO's are weakly pulled up by 100K internal resistor. The **PULLUP\_RESISTOR** attribute is effective only when **PULLUP** parameter is set to 1.

### Synthesis Attribute Syntax:

```
/* synthesis PULLUP_RESISTOR = "3P3K" */
```

#### Resistor Value:

Resistor Value	Description.
"3P3K"	Pull up resistor level is 3.3K.
"6P8K"	Pull up resistor level is 6.8K.
"10K"	Pull up resistor level is 10K.
"100K"	Pull up resistor level is 100K. (Default)

**Note:** **PULLUP\_RESISTOR** attribute is supported only for iCE40UL devices.

## Verilog Instantiation

```
SB_IO      IO_PIN_INST
(
    .PACKAGE_PIN (Package_Pin),           // User's Pin signal name
    .LATCH_INPUT_VALUE (latch_input_value), // Latches/holds the Input value
    .CLOCK_ENABLE (clock_enable),         // Clock Enable common to input and
                                           // output clock
    .INPUT_CLK (input_clk),               // Clock for the input registers
    .OUTPUT_CLK (output_clk),             // Clock for the output registers
    .OUTPUT_ENABLE (output_enable),       // Output Pin Tristate/Enable
                                           // control
    .D_OUT_0 (d_out_0),                   // Data 0 - out to Pin/Rising clk
                                           // edge
    .D_OUT_1 (d_out_1),                   // Data 1 - out to Pin/Falling clk
                                           // edge
    .D_IN_0 (d_in_0),                     // Data 0 - Pin input/Rising clk
                                           // edge

                                           // edge
) /* synthesis DRIVE_STRENGTH= x2 */;

defparam IO_PIN_INST.PIN_TYPE = 6'b000000;
// See Input and Output Pin Function Tables.
// Default value of PIN_TYPE = 6'000000 i.e.
// an input pad, with the input signal
// registered.
defparam IO_PIN_INST.PULLUP = 1'b0;
// By default, the IO will have NO pull up.
// This parameter is used only on bank 0, 1,
// and 2. Ignored when it is placed at bank 3
defparam IO_PIN_INST.NEG_TRIGGER = 1'b0;
// Specify the polarity of all FFs in the IO to
// be falling edge when NEG_TRIGGER = 1.
// Default is rising edge.
defparam IO_PIN_INST.IO_STANDARD = "SB_LVCMOS";
// Other IO standards are supported in bank 3
// only: SB_SSTL2_CLASS_2, SB_SSTL2_CLASS_1,
// SB_SSTL18_FULL, SB_SSTL18_HALF, SB_MDDR10,
// SB_MDDR8, SB_MDDR4, SB_MDDR2 etc.
```

# Global Buffer Primitives

## SB\_GB\_IO

### Default Signal Values

The iCEcube2 software assigns the logic '0' value to all unconnected input ports except for CLOCK\_ENABLE.

Note that explicitly connecting a logic '1' value to port CLOCK\_ENABLE will result in a non-optimal implementation, since an extra LUT will be used to generate the Logic '1'. If the user's intention is to keep the Input and Output registers always enabled, it is recommended that port CLOCK\_ENABLE be left unconnected.

### Verilog Instantiation

```
SB_GB_IO My_Clock_Buffer_Package_Pin (    // A users external Clock reference
                                           pin
    .PACKAGE_PIN (Package_Pin),           // User's Pin signal name
    .LATCH_INPUT_VALUE (latch_input_value), // Latches/holds the Input value
    .CLOCK_ENABLE (clock_enable),         // Clock Enable common to input and
                                           // output clock
```

```

.INPUT_CLK (input_clk),           // Clock for the input registers
.OUTPUT_CLK (output_clk),         // Clock for the output registers
.OUTPUT_ENABLE (output_enable),   // Output Pin Tristate/Enable
                                   // control
.D_OUT_0 (d_out_0),              // Data 0 - out to Pin/Rising clk
                                   // edge
.D_OUT_1 (d_out_1),              // Data 1 - out to Pin/Falling clk
                                   // edge
.D_IN_0 (d_in_0),                // Data 0 - Pin input/Rising clk
                                   // edge
.D_IN_1 (d_in_1)                 // Data 1 - Pin input/Falling clk
                                   // edge

.GLOBAL_BUFFER_OUTPUT (Global_Buffered_User_Clock)
                                   // Example use - clock buffer
                                   //driven from the input pin
);

defparam  My_Clock_Buffer_Package_Pin.PIN_TYPE = 6'b000000;
                                   // See Input and Output Pin Function Tables.
                                   // Default value of PIN_TYPE = 6'000000 i.e.
                                   // an input pad, with the input signal
                                   // registered

```

*Note that this primitive is a superset of the SB\_IO primitive, and includes the connectivity to drive a Global Buffer. For example SB\_GB\_IO pins are likely to be used for external Clocks.*

## SB\_GB Primitive

## Verilog Instantiation

```

SB_GB My_Global_Buffer_i (        //Required for a user's internally generated
                                   //FPGA signal that is heavily loaded and
                                   //requires global buffering. For example, a

```

# PLL Primitives

The Phase Lock Loop (PLL) function is offered as a feature in certain iCE device packages.

It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

## iCE40 PLL Primitives

There are 5 primitives that represent the PLL function in the iCEcube2 software viz. SB\_PLL40\_CORE, SB\_PLL40\_PAD, SB\_PLL40\_2\_PAD, SB\_PLL40\_2F\_CORE and SB\_PLL40\_2F\_PAD for the ice40 device family. A short description of each primitive and its ports/parameters is provided in the following sections.

It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

### SB\_PLL40\_CORE

The SB\_PLL40\_CORE primitive should be used when the source clock of the PLL is driven by FPGA routing i.e. when the PLL source clock originates on the FPGA or is driven by an input pad that is not in the bottom IO bank (IO Bank 2).

### Ports

**REFERENCECLK:** PLL source clock that serves as the input to the SB\_PLL40\_CORE primitive.

**PLLOUTGLOBAL:** Output clock generated by the PLL, drives a global clock network on the FPGA.

**PLLOUTCORE:** Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTGLOBAL port.

**LOCK:** Output port, when HIGH, indicates that the signal on PLLOUTGLOBAL/PLLOUTCORE is locked to the PLL source on REFERENCECLK.

**EXTFEEDBACK:** External feedback input to PLL. Enabled when the FEEDBACK\_PATH parameter is set to EXTERNAL.

*DYNAMICDELAY*: 7 bit input bus that enables dynamic control of the delay contributed by the Fine Delay Adjust Block. The Fine Delay Adjust Block is used when there is a need to adjust the phase alignment of PLLOUTGLOBAL/PLLOUTCORE with respect to REFERENCECLK. The DYNAMICDELAY port controls are enabled when the DELAY\_ADJUSTMENT\_MODE parameter is set to DYNAMIC.

*RESETB*: Active low input that asynchronously resets the PLL.

*BYPASS*: Input signal, when asserted, connects the signal on REFERENCECLK to PLLOUTCORE/PLLOUTGLOBAL pins.

*LATCHINPUTVALUE*: Active high input, when enabled, forces the PLL into low-power mode. The PLLOUTGLOBAL/PLLOUTCORE pins are held static at their last value. This function is enabled when the parameter ENABLE\_ICEGATE is set to '1'.

*SCLK*, *SDI*, *SDO*: These pins are used only for internal testing purposes, and need not be instantiated by users.

## **Parameters**

The SB\_PLL40\_CORE primitive requires configuration through the specification of the following parameters. It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

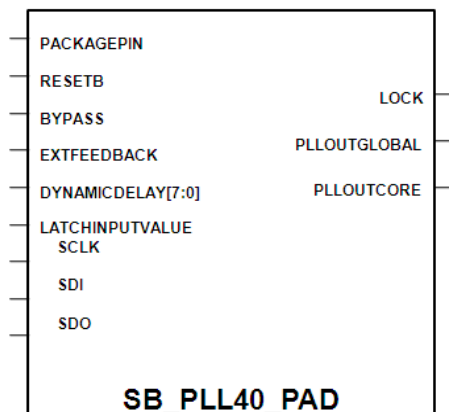

Parameter Name	Description	Parameter Value	Description
FEEDBACK_PATH	Selects the feedback path to the PLL	SIMPLE	Feedback is internal to the PLL, directly from VCO
		DELAY	Feedback is internal to the PLL, through the Fine Delay Adjust Block
		PHASE_AND_DELAY	Feedback is internal to the PLL, through the Phase Shifter and the Fine Delay Adjust Block
		EXTERNAL	Feedback path is external to the PLL, and connects to EXTFEEDBACK pin. Also uses the Fine Delay Adjust Block.
DELAY_ADJUSTMENT_MODE_FEEDBACK	Selects the mode for the Fine Delay Adjust block in the feedback path	FIXED	Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_FEEDBACK parameter setting
		DYNAMIC	Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[3:0] pins
FDA_FEEDBACK	Sets a constant value for the Fine Delay Adjust Block in the feedback path	0, 1,...,15	The PLLOUTGLOBAL & PLLOUTCORE signals are delay compensated by $(n+1)*150$ ps, where $n = \text{FDA\_FEEDBACK}$ only if the setting of the DELAY_ADJUSTMENT_MODE_FEEDBACK is FIXED.
DELAY_ADJUSTMENT_MODE_RELATIVE	Selects the mode for the Fine Delay Adjust block	FIXED	Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_RELATIVE parameter setting
		DYNAMIC	Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[7:4] pins
FDA_RELATIVE	Sets a constant value for the Fine Delay Adjust Block	0, 1,...,15	The PLLOUTGLOBALA & PLLOUTCOREA signals are additionally delayed by $(n+1)*150$ ps, where $n = \text{FDA\_RELATIVE}$ . Used if DELAY_ADJUSTMENT_MODE_RELATIVE is "FIXED".
SHIFTREG_DIV_MODE	Selects shift register configuration	0,1	Used when FEEDBACK_PATH is "PHASE_AND_DELAY". 0→Divide by 4 1→Divide by 7
PLLOUT_SELECT	Selects the signal to be output at the PLLOUTCORE and PLLOUTGLOBAL ports	SHIFTREG_0deg	0° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY"
		SHIFTREG_90deg	90° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" and SHIFTREG_DIV_MODE=0
		GENCLK	The internally generated PLL frequency will be output without any phase shift.
		GENCLK_HALF	The internally generated PLL frequency will be divided by 2 and then output. No phase shift.
DIVR	REFERENCECLK divider	0,1,2,...,15	These parameters are used to

DIVF	Feedback divider	0,1,...,63	control the output frequency, depending on the FEEDBACK_PATH setting.
DIVQ	VCO Divider	1,2,...,6	
FILTER_RANGE	PLL Filter Range	0,1,...,7	
EXTERNAL_DIVIDE_FACTOR	Divide-by factor of a divider in external feedback path	User specified value. Default 1	Specified only when there is a user-implemented divider in the external feedback path.
ENABLE_ICEGATE	Enables the PLL power-down control	0	Power-down control disabled
		1	Power-down controlled by LATCHINPUTVALUE input

## SB\_PLL40\_PAD

The SB\_PLL40\_PAD primitive should be used when the source clock of the PLL is driven by an input pad that is located in the bottom IO bank (IO Bank 2) or the top IO bank (IO Bank 0), and the source clock is not required inside the FPGA.

### Ports

**PACKAGEPIN:** PLL REFERENCE CLOCK pin that serves as the input to the SB\_PLL40\_PAD primitive.

**PLLOUTGLOBAL:** Output clock generated by the PLL, drives a global clock network on the FPGA.

**PLLOUTCORE:** Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTGLOBAL port.

**LOCK:** Output port, when HIGH, indicates that the signal on PLLOUTGLOBAL/PLLOUTCORE is locked to the PLL source on PACKAGEPIN.

**EXTFEEDBACK:** External feedback input to PLL. Enabled when the FEEDBACK\_PATH parameter is set to EXTERNAL.

**DYNAMICDELAY:** 7 bit input bus that enables dynamic control of the delay contributed by the Fine Delay Adjust Block. The Fine Delay Adjust Block is used when there is a need to adjust the phase alignment of PLLOUTGLOBAL/PLLOUTCORE with respect to PACKAGEPIN. The DYNAMICDELAY port controls are enabled when the DELAY\_ADJUSTMENT\_MODE parameter is set to DYNAMIC.

**RESETB:** Active low input that asynchronously resets the PLL.

**BYPASS:** Input signal, when asserted, connects the signal on PACKAGEPIN to PLLOUTCORE/PLLOUTGLOBAL pins.

**LATCHINPUTVALUE:** Active high input, when enabled, forces the PLL into low-power mode. The PLLOUTGLOBAL/PLLOUTCORE pins are held static at their last value. This function is enabled when the parameter ENABLE\_ICEGATE is set to '1'.

**SCLK, SDI, SDO:** These pins are used only for internal testing purposes, and need not be instantiated by users.

## **Parameters**

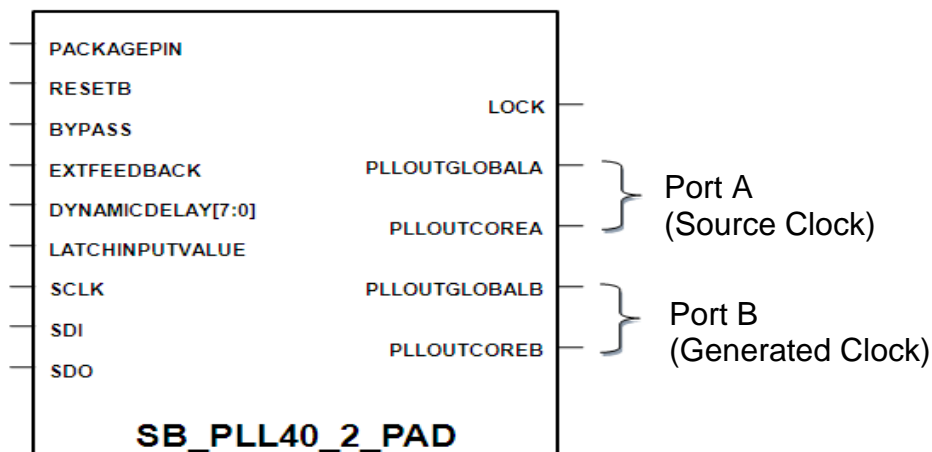

The SB\_PLL40\_PAD primitive requires configuration through the specification of the following parameters. It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

Parameter Name	Description	Parameter Value	Description
FEEDBACK_PATH	Selects the feedback path to the PLL	SIMPLE	Feedback is internal to the PLL, directly from VCO
		DELAY	Feedback is internal to the PLL, through the Fine Delay Adjust Block
		PHASE_AND_DELAY	Feedback is internal to the PLL, through the Phase Shifter and the Fine Delay Adjust Block
		EXTERNAL	Feedback path is external to the PLL, and connects to EXTFEEDBACK pin. Also uses the Fine Delay Adjust Block.
DELAY_ADJUSTMENT_MODE_FEEDBACK	Selects the mode for the Fine Delay Adjust block in the feedback path	FIXED	Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_FEEDBACK parameter setting
		DYNAMIC	Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY [3:0] pins
FDA_FEEDBACK	Sets a constant value for the Fine Delay Adjust Block in the feedback path	0, 1,...,15	The PLLOUTGLOBAL & PLLOUTCORE signals are delay compensated by $(n+1)*150$ ps, where $n = \text{FDA\_FEEDBACK}$ only if the setting of the DELAY_ADJUSTMENT_MODE_FEEDBACK is FIXED.
DELAY_ADJUSTMENT_MODE_RELATIVE	Selects the mode for the Fine Delay Adjust block	FIXED	Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_RELATIVE parameter setting
		DYNAMIC	Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[7:4] pins
FDA_RELATIVE	Sets a constant value for the Fine Delay Adjust Block	0, 1,...,15	The PLLOUTGLOBALA & PLLOUTCOREA signals are additionally delayed by $(n+1)*150$ ps, where $n = \text{FDA\_RELATIVE}$ . Used if DELAY_ADJUSTMENT_MODE_RELATIVE is "FIXED".
SHIFTREG_DIV_MODE	Selects shift register configuration	0,1	Used when FEEDBACK_PATH is "PHASE_AND_DELAY". 0→Divide by 4 1→Divide by 7
PLLOUT_SELECT	Selects the signal to be output at the PLLOUTCORE and PLLOUTGLOBAL ports	SHIFTREG_0deg	0° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY"
		SHIFTREG_90deg	90° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" and SHIFTREG_DIV_MODE=0
		GENCLK	The internally generated PLL frequency will be output without any phase shift.
		GENCLK_HALF	The internally generated PLL frequency will be divided by 2 and then output. No phase shift.
DIVR	REFERENCECLK divider	0,1,2,...,15	These parameters are used to

DIVF	Feedback divider	0,1,...,63	control the output frequency, depending on the FEEDBACK_PATH setting.
DIVQ	VCO Divider	1,2,...,6	
FILTER_RANGE	PLL Filter Range	0,1,...,7	
EXTERNAL_DIVIDE_FACTOR	Divide-by factor of a divider in external feedback path	User specified value. Default 1	Specified only when there is a user-implemented divider in the external feedback path.
ENABLE_ICEGATE	Enables the PLL power-down control	0	Power-down control disabled
		1	Power-down controlled by LATCHINPUTVALUE input

## SB\_PLL40\_2\_PAD

The SB\_PLL40\_2\_PAD primitive should be used when the source clock of the PLL is driven by an input pad that is located in the bottom IO bank (IO Bank 2) or the top IO bank (IO Bank 0), and in addition to the PLL output, the source clock is also required inside the FPGA.

### Ports

**PACKAGEPIN:** PLL REFERENCE CLOCK pin that serves as the input to the SB\_PLL40\_2\_PAD primitive.

**PLLOUTGLOBALA:** The signal on PACKAGEPIN appears on the FPGA at this pin, and drives a global clock network on the FPGA. Do not use this pin in an external feedback path to the PLL.

**PLLOUTCOREA:** The signal on PACKAGEPIN appears on the FPGA at this pin, which drives regular FPGA routing. Do not use this pin in an external feedback path to the PLL.

**PLLOUTGLOBALB:** Output clock generated by the PLL, drives a global clock network on the FPGA.

**PLLOUTCOREB:** Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTGLOBAL port.

**LOCK:** Output port, when HIGH, indicates that the signal on PLLOUTGLOBALB/PLLOUTCOREB is locked to the PLL source on PACKAGEPIN.

**EXTFEEDBACK:** External feedback input to PLL. Enabled when the FEEDBACK\_PATH parameter is set to EXTERNAL.

**DYNAMICDELAY:** 4 bit input bus that enables dynamic control of the delay contributed by the Fine Delay Adjust Block. The Fine Delay Adjust Block is used when there is a need to adjust the phase alignment of PLLOUTGLOBAL/PLLOUTCORE with respect to PACKAGEPIN. The DYNAMICDELAY port controls are enabled when the DELAY\_ADJUSTMENT\_MODE parameter is set to DYNAMIC.

**RESET:** Active low input that asynchronously resets the PLL.

**BYPASS:** Input signal, when asserted, connects the signal on PACKAGEPIN to PLLOUTCORE/PLLOUTGLOBAL pins.

*LATCHINPUTVALUE*: Active high input, when enabled, forces the PLL into low-power mode. The PLLOUTGLOBALA/PLLOUTCOREA pins are held static at their last value only when the parameter ENABLE\_ICEGATE\_PORTA is set to '1', and the LATCHINPUTVALUE signal is asserted. The PLLOUTGLOBALB/PLLOUTCOREB pins are held static at their last value only when the parameter ENABLE\_ICEGATE\_PORTB is set to '1', and the LATCHINPUTVALUE signal is asserted.

*SCLK, SDI, SDO*: These pins are used only for internal testing purposes, and need not be instantiated by users.

## **Parameters**

The SB\_PLL40\_2\_PAD primitive requires configuration through the specification of the following parameters. It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

Parameter Name	Description	Parameter Value	Description
FEEDBACK_PATH	Selects the feedback path to the PLL	SIMPLE	Feedback is internal to the PLL, directly from VCO
		DELAY	Feedback is internal to the PLL, through the Fine Delay Adjust Block
		PHASE_AND_DELAY	Feedback is internal to the PLL, through the Phase Shifter and the Fine Delay Adjust Block
		EXTERNAL	Feedback path is external to the PLL, and connects to EXTFEEDBACK pin. Also uses the Fine Delay Adjust Block.
DELAY_ADJUSTMENT_MODE_FEEDBACK	Selects the mode for the Fine Delay Adjust block in the feedback path	FIXED	Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_FEEDBACK parameter setting
		DYNAMIC	Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[3:0] pins
FDA_FEEDBACK	Sets a constant value for the Fine Delay Adjust Block in the feedback path	0, 1,...,15	The PLLOUTGLOBAL & PLLOUTCORE signals are delay compensated by $(n+1)*150$ ps, where $n = \text{FDA\_FEEDBACK}$ only if the setting of the DELAY_ADJUSTMENT_MODE_FEEDBACK is FIXED.
DELAY_ADJUSTMENT_MODE_RELATIVE	Selects the mode for the Fine Delay Adjust block	FIXED	Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_RELATIVE parameter setting
		DYNAMIC	Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[7:4] pins
FDA_RELATIVE	Sets a constant value for the Fine Delay Adjust Block	0, 1,...,15	The PLLOUTGLOBALA & PLLOUTCOREA signals are delayed w.r.t. the Port B signals, by $(n+1)*150$ ps, where $n = \text{FDA\_RELATIVE}$ . Used if DELAY_ADJUSTMENT_MODE_RELATIVE is "FIXED".
SHIFTREG_DIV_MODE	Selects shift register configuration	0,1	Used when FEEDBACK_PATH is "PHASE_AND_DELAY". 0→Divide by 4 1→Divide by 7
PLLOUT_SELECT_PORTB	Selects the signal to be output at the PLLOUTCOREB and PLLOUTGLOBALB ports	SHIFTREG_0deg	0° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY"
		SHIFTREG_90deg	90° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" and SHIFTREG_DIV_MODE=0
		GENCLK	The internally generated PLL frequency will be output to PortB. No phase shift.
		GENCLK_HALF	The internally generated PLL frequency will be divided by 2 and then output to PORTB. No phase shift.

DIVR	REFERENCECLK divider	0,1,2,...,15	These parameters are used to control the output frequency, depending on the FEEDBACK_PATH setting.
DIVF	Feedback divider	0,1,...,63	
DIVQ	VCO Divider	1,2,...,6	
FILTER_RANGE	PLL Filter Range	0,1,...,7	
EXTERNAL_DIVIDE_FACTOR	Divide-by factor of a divider in external feedback path	User specified value. Default 1	Specified only when there is a user-implemented divider in the external feedback path.
ENABLE_ICEGATE_PORTA	Enables the PLL power-down control	0	Power-down control disabled
		1	Power-down controlled by LATCHINPUTVALUE input
ENABLE_ICEGATE_PORTB	Enables the PLL power-down control	0	Power-down control disabled
		1	Power-down controlled by LATCHINPUTVALUE input

## SB\_PLL40\_2F\_CORE

The SB\_PLL40\_2F\_CORE primitive should be used when PLL is used to generate 2 different output frequencies, and the source clock of the PLL is driven by FPGA routing i.e. when the PLL source clock originates on the FPGA.

## Ports

**REFERENCECLK:** PLL source clock that serves as the input to the SB\_PLL40\_2F\_CORE primitive.

**PLLOUTGLOBALA:** Output clock generated by the PLL, drives a global clock network on the FPGA.

**PLLOUTCOREA:** Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTGLOBALA port.

**PLLOUTGLOBALB:** Output clock generated by the PLL, drives a global clock network on the FPGA.

**PLLOUTCOREB:** Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTGLOBALB port.

**LOCK:** Output port, when HIGH, indicates that the signal on PLLOUTGLOBALB/PLLOUTCOREB is locked to the PLL source on PACKAGEPIN.

*EXTFEEDBACK*: External feedback input to PLL. Enabled when the *FEEDBACK\_PATH* parameter is set to *EXTERNAL*.

*DYNAMICDELAY*: 4 bit input bus that enables dynamic control of the delay contributed by the Fine Delay Adjust Block. The Fine Delay Adjust Block is used when there is a need to adjust the phase alignment of *PLLOUTGLOBAL/PLLOUTCORE* with respect to *REFERENCECLK*. The *DYNAMICDELAY* port controls are enabled when the *DELAY\_ADJUSTMENT\_MODE* parameter is set to *DYNAMIC*.

*RESETB*: Active low input that asynchronously resets the PLL.

*BYPASS*: Input signal, when asserted, connects the signal on *REFERENCECLK* to *PLLOUTCORE/PLLOUTGLOBAL* pins.

*LATCHINPUTVALUE*: Active high input, when enabled, forces the PLL into low-power mode. The *PLLOUTGLOBALA/PLLOUTCOREA* pins are held static at their last value only when the parameter *ENABLE\_ICEGATE\_PORTA* is set to '1', and the *LATCHINPUTVALUE* signal is asserted. The *PLLOUTGLOBALB/PLLOUTCOREB* pins are held static at their last value only when the parameter *ENABLE\_ICEGATE\_PORTB* is set to '1', and the *LATCHINPUTVALUE* signal is asserted.

*SCLK*, *SDI*, *SDO*: These pins are used only for internal testing purposes, and need not be instantiated by users.

## **Parameters**

The *SB\_PLL40\_2F\_CORE* primitive requires configuration through the specification of the following parameters. It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

Parameter Name	Description	Parameter Value	Description
FEEDBACK_PATH	Selects the feedback path to the PLL	SIMPLE	Feedback is internal to the PLL, directly from VCO
		DELAY	Feedback is internal to the PLL, through the Fine Delay Adjust Block
		PHASE_AND_DELAY	Feedback is internal to the PLL, through the Phase Shifter and the Fine Delay Adjust Block
		EXTERNAL	Feedback path is external to the PLL, and connects to EXTFEEDBACK pin. Also uses the Fine Delay Adjust Block.
DELAY_ADJUSTMENT_MODE_FEEDBACK	Selects the mode for the Fine Delay Adjust block in the feedback path	FIXED	Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_FEEDBACK parameter setting
		DYNAMIC	Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[3:0] pins
FDA_FEEDBACK	Sets a constant value for the Fine Delay Adjust Block in the feedback path	0, 1,...,15	The PLLOUTGLOBALA & PLLOUTCOREA signals are delay compensated by $(n+1)*150$ ps, where $n = \text{FDA\_FEEDBACK}$ only if the setting of the DELAY_ADJUSTMENT_MODE_FEEDBACK is FIXED.
DELAY_ADJUSTMENT_MODE_RELATIVE	Selects the mode for the Fine Delay Adjust block	FIXED	Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_RELATIVE parameter setting
		DYNAMIC	Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[7:4] pins
FDA_RELATIVE	Sets a constant value for the Fine Delay Adjust Block	0, 1,...,15	The PLLOUTGLOBALA & PLLOUTCOREA signals are delayed w.r.t. the Port B signals, by $(n+1)*150$ ps, where $n = \text{FDA\_RELATIVE}$ . Used if DELAY_ADJUSTMENT_MODE_RELATIVE is "FIXED".
SHIFTREG_DIV_MODE	Selects shift register configuration	0,1	Used when FEEDBACK_PATH is "PHASE_AND_DELAY". 0→Divide by 4 1→Divide by 7
PLLOUT_SELECT_PORTA	Selects the signal to be output at the PLLOUTCOREA and PLLOUTGLOBALA ports	SHIFTREG_0deg	0° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY"
		SHIFTREG_90deg	90° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" and SHIFTREG_DIV_MODE=0
		GENCLK	The internally generated PLL frequency will be output to PortA. No phase shift.
		GENCLK_HALF	The internally generated PLL frequency will be divided by 2 and then output to PORTA. No phase shift.

PLLOUT_SELECT_PORTB	Selects the signal to be output at the PLLOUTCOREB and PLLOUTGLOBALB ports	SHIFTREG_0deg	0° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY"
		SHIFTREG_90deg	90° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" and SHIFTREG_DIV_MODE=0
		GENCLK	The internally generated PLL frequency will be output to PortB. No phase shift.
		GENCLK_HALF	The internally generated PLL frequency will be divided by 2 and then output to PORTB. No phase shift.
DIVR	REFERENCECLK divider	0,1,2,...,15	These parameters are used to control the output frequency, depending on the FEEDBACK_PATH setting.
DIVF	Feedback divider	0,1,...,63	
DIVQ	VCO Divider	1,2,...,6	
FILTER_RANGE	PLL Filter Range	0,1,...,7	
EXTERNAL_DIVIDE_FACTOR	Divide-by factor of a divider in external feedback path	User specified value. Default 1	Specified only when there is a user-implemented divider in the external feedback path.
ENABLE_ICEGATE_PORTA	Enables the PLL power-down control	0	Power-down control disabled
		1	Power-down controlled by LATCHINPUTVALUE input
ENABLE_ICEGATE_PORTB	Enables the PLL power-down control	0	Power-down control disabled
		1	Power-down controlled by LATCHINPUTVALUE input

## SB\_PLL40\_2F\_PAD

The SB\_PLL40\_2F\_PAD primitive should be used when the PLL is used to generate 2 different output frequencies, and the source clock of the PLL is driven by an input pad located in the bottom IO bank (IO Bank 2) or the top IO bank (IO Bank 0).

### Ports

**PACKAGEPIN:** PLL REFERENCE CLOCK pin that serves as the input to the SB\_PLL40\_2F\_PAD primitive.

**PLLOUTGLOBALA:** Output clock generated by the PLL, drives a global clock network on the FPGA.

**PLLOUTCOREA:** Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTGLOBALA port.

**PLLOUTGLOBALB:** Output clock generated by the PLL, drives a global clock network on the FPGA.

**PLLOUTCOREB:** Output clock generated by the PLL, drives regular FPGA routing. The frequency generated on this output is the same as the frequency of the clock signal generated on the PLLOUTGLOBALB port.

**LOCK:** Output port, when HIGH, indicates that the signal on PLLOUTGLOBALB/PLLOUTCOREB is locked to the PLL source on PACKAGEPIN.

**EXTFEEDBACK:** External feedback input to PLL. Enabled when the FEEDBACK\_PATH parameter is set to EXTERNAL.

**DYNAMICDELAY:** 4 bit input bus that enables dynamic control of the delay contributed by the Fine Delay Adjust Block. The Fine Delay Adjust Block is used when there is a need to adjust the phase alignment of PLLOUTGLOBAL/PLLOUTCORE with respect to PACKAGEPIN. The DYNAMICDELAY port controls are enabled when the DELAY\_ADJUSTMENT\_MODE parameter is set to DYNAMIC.

**RESETB:** Active low input that asynchronously resets the PLL.

**BYPASS:** Input signal, when asserted, connects the signal on PACKAGEPIN to PLLOUTCORE/PLLOUTGLOBAL pins.

*LATCHINPUTVALUE*: Active high input, when enabled, forces the PLL into low-power mode. The PLLOUTGLOBALA/PLLOUTCOREA pins are held static at their last value only when the parameter ENABLE\_ICEGATE\_PORTA is set to '1', and the LATCHINPUTVALUE signal is asserted. The PLLOUTGLOBALB/PLLOUTCOREB pins are held static at their last value only when the parameter ENABLE\_ICEGATE\_PORTB is set to '1', and the LATCHINPUTVALUE signal is asserted.

*SCLK, SDI, SDO*: These pins are used only for internal testing purposes, and need not be instantiated by users.

## **Parameters**

The SB\_PLL40\_2F\_PAD primitive requires configuration through the specification of the following parameters. It is strongly recommended that the configuration of the PLL primitives be accomplished through the use of the PLL Configuration tool that is offered as part of the iCEcube2 software.

Parameter Name	Description	Parameter Value	Description
FEEDBACK_PATH	Selects the feedback path to the PLL	SIMPLE	Feedback is internal to the PLL, directly from VCO
		DELAY	Feedback is internal to the PLL, through the Fine Delay Adjust Block
		PHASE_AND_DELAY	Feedback is internal to the PLL, through the Phase Shifter and the Fine Delay Adjust Block
		EXTERNAL	Feedback path is external to the PLL, and connects to EXTFEEDBACK pin. Also uses the Fine Delay Adjust Block.
DELAY_ADJUSTMENT_MODE_FEEDBACK	Selects the mode for the Fine Delay Adjust block in the feedback path	FIXED	Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_FEEDBACK parameter setting
		DYNAMIC	Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[3:0] pins
FDA_FEEDBACK	Sets a constant value for the Fine Delay Adjust Block in the feedback path	0, 1,...,15	The PLLOUTGLOBALA & PLLOUTCOREA signals are delay compensated by $(n+1)*150$ ps, where $n = \text{FDA\_FEEDBACK}$ only if the setting of the DELAY_ADJUSTMENT_MODE_FEEDBACK is FIXED.
DELAY_ADJUSTMENT_MODE_RELATIVE	Selects the mode for the Fine Delay Adjust block	FIXED	Delay of the Fine Delay Adjust Block is fixed, the value is specified by the FDA_RELATIVE parameter setting
		DYNAMIC	Delay of Fine Delay Adjust Block is determined by the signal value at the DYNAMICDELAY[7:4] pins
FDA_RELATIVE	Sets a constant value for the Fine Delay Adjust Block	0, 1,...,15	The PLLOUTGLOBALA & PLLOUTCOREA signals are delayed w.r.t. the Port B signals, by $(n+1)*150$ ps, where $n = \text{FDA\_RELATIVE}$ . Used if DELAY_ADJUSTMENT_MODE_RELATIVE is "FIXED".
SHIFTREG_DIV_MODE	Selects shift register configuration	0,1	Used when FEEDBACK_PATH is "PHASE_AND_DELAY". 0→Divide by 4 1→Divide by 7
PLLOUT_SELECT_PORTA	Selects the signal to be output at the PLLOUTCOREA and PLLOUTGLOBALA ports	SHIFTREG_0deg	0° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY"
		SHIFTREG_90deg	90° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" and SHIFTREG_DIV_MODE=0
		GENCLK	The internally generated PLL frequency will be output to PortA. No phase shift.
		GENCLK_HALF	The internally generated PLL frequency will be divided by 2 and then output to PORTA. No phase shift.

PLLOUT_SELECT_PORTB	Selects the signal to be output at the PLLOUTCOREB and PLLOUTGLOBALB ports	SHIFTREG_0deg	0° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY"
		SHIFTREG_90deg	90° phase shift only if the setting of FEEDBACK_PATH is "PHASE_AND_DELAY" and SHIFTREG_DIV_MODE=0
		GENCLK	The internally generated PLL frequency will be output to PortB. No phase shift.
		GENCLK_HALF	The internally generated PLL frequency will be divided by 2 and then output to PORTB. No phase shift.
DIVR	REFERENCECLK divider	0,1,2,...,15	These parameters are used to control the output frequency, depending on the FEEDBACK_PATH setting.
DIVF	Feedback divider	0,1,...,63	
DIVQ	VCO Divider	1,2,...,6	
FILTER_RANGE	PLL Filter Range	0,1,...,7	
EXTERNAL_DIVIDE_FACTOR	Divide-by factor of a divider in external feedback path	User specified value. Default 1	Specified only when there is a user-implemented divider in the external feedback path.
ENABLE_ICEGATE_PORTA	Enables the PLL power-down control	0	Power-down control disabled
		1	Power-down controlled by LATCHINPUTVALUE input
ENABLE_ICEGATE_PORTB	Enables the PLL power-down control	0	Power-down control disabled
		1	Power-down controlled by LATCHINPUTVALUE input

# Hard Macro Primitives

## *iCE40LM Hard Macros*

This section describes the following dedicated hard macro primitives available in iCE40LM devices.

SB\_HSOSC (macro primitive for HSSG)

SB\_LSOSC (macro primitive for LPSG)

SB\_I2C

SB\_SPI

### ***SB\_HSOSC (For HSSG)***

SB\_HSOSC primitive can be used to instantiate High Speed Strobe Generator (HSSG), which generates 12 MHz strobe signal. The strobe can drive either the global clock network or fabric routes directly based on the clock network selection.

### **Ports**

SB_HSOSC Ports		
Signal Name	Direction	Description
ENACLKM	Input	Enable High Speed Strobe Generator. Active High.
CLKM	Output	Strobe Generator Output (12Mhz).

### **Clock Network Selection**

By default the strobe generator use one of the dedicated clock networks in the device to drive the elements. The user may configure the strobe generator to use the fabric routes instead of global clock network using the synthesis attributes.

### **Synthesis Attribute**

```
/* synthesis ROUTE_THROUGH_FABRIC=<value> */
```

Value:

0: Use dedicated clock network. Default option.

1: Use fabric routes.

### **Verilog Instantiation**

```
SB_HSOSC OSCInst0 (  
    .ENACLKM(ENACLKM),  
    .CLKM(CLKM)  
) /* synthesis ROUTE_THROUGH_FABRIC= [0|1] */;
```

## SB\_LSOSC (For LPSG)

SB\_LSOSC primitive can instantiate Low Power Strobe Generator (LPSG), which generates 10 KHz strobe signal. The strobe can drive either the global clock network or fabric routes directly based on the clock network selection.

### Ports

SB_LSOSC Ports		
Signal Name	Direction	Description
ENACLKK	Input	Enable Low Power Strobe Generator. Active High.
CLKK	Output	Strobe Generator Output (10Khz).

### Clock Network Selection

By default the strobe generator use one of the dedicated clock networks in the device to drive the elements. The user may configure the strobe generator to use the fabric routes instead of global clock network using the synthesis attribute.

### Synthesis Attribute:

```
/* synthesis ROUTE_THROUGH_FABRIC=<value> */
```

Value:

- 0: Use dedicated clock network. Default option.
- 1: Use fabric routes.

### Verilog Instantiation

```
SB_LSOSC OSCInst0 (  
    .ENACLKK(ENACLKK),  
    .CLKK(CLKK)  
) /* synthesis ROUTE_THROUGH_FABRIC= [0|1] */;
```

## SB\_I2C

The I2C hard IP provides industry standard two pin communication interface that conforms to V2.1 of the I2C bus specification. It could be configured as either master or slave port. In master mode, it support configurable data transfer rate and perform arbitration detection to allow it to operate in multi-master systems. It supports both 7 bits and 10 bits addressing in slave mode with configurable slave address and clock stretching in both master and slave mode with enable/disable capability.

iCE40LM device supports two I2C hard IP primitives , located at upper left corner and upper right corner of the chip.

## Ports

SB_I2C Ports		
Signal Name	Direction	Description
SBCLKI	Input	System Clock input.
SBRWI	Input	System Read/Write Input.
SBSTBI	Input	Strobe Signal
SBADRI0	Input	System Bus Control registers address. Bit 0.
SBADRI1	Input	System Bus Control registers address. Bit 1.
SBADRI2	Input	System Bus Control registers address. Bit 2.
SBADRI3	Input	System Bus Control registers address. Bit 3.
SBADRI4	Input	System Bus Control registers address. Bit 4.
SBADRI5	Input	System Bus Control registers address. Bit 5.
SBADRI6	Input	System Bus Control registers address. Bit 6.
SBADRI7	Input	System Bus Control registers address. Bit 7.
SBDATI0	Input	System Data Input. Bit 0.
SBDATI1	Input	System Data input. Bit 1.
SBDATI2	Input	System Data input. Bit 2.
SBDATI3	Input	System Data input. Bit 3.
SBDATI4	Input	System Data input. Bit 4.
SBDATI5	Input	System Data input. Bit 5.
SBDATI6	Input	System Data input. Bit 6.
SBDATI7	Input	System Data input. Bit 7.
SBDATO0	Output	System Data Output. Bit 0.
SBDATO1	Output	System Data Output. Bit 1.
SBDATO2	Output	System Data Output. Bit 2.
SBDATO3	Output	System Data Output. Bit 3.
SBDATO4	Output	System Data Output. Bit 4.
SBDATO5	Output	System Data Output. Bit 5.
SBDATO6	Output	System Data Output. Bit 6.
SBDATO7	Output	System Data Output. Bit 7.

SBACKO	Output	System Acknowledgement.
I2CIRQ	Output	I2C Interrupt output.
I2CWKUP	Output	I2C Wake Up from Standby signal.
SCLI	Input	Serial Clock Input.
SCLO	Output	Serial Clock Output
SCLOE	Output	Serial Clock Output Enable. Active High.
SDAI	Input	Serial Data Input
SDAO	Output	Serial Data Output
SDAOE	Output	Serial Data Output Enable. Active High.

## Parameters

I2C Primitive requires configuring certain parameters for slave initial address and selecting I2C IP location.

I2C Location	Parameters	Parameter Default Value.	Description.
Upper Left Corner	I2C_SLAVE_INIT_ADDR	0b1111100001	Upper Bits <9:2> can be changed through control registers. Lower bits <1:0> are fixed.
	BUS_ADDR74	0b0001	Fixed value. SBADRI [7:4] bits also should match with this value to activate the IP.
Upper Right Corner	I2C_SLAVE_INIT_ADDR	0b1111100010	Upper Bits <9:2> can be changed through control registers. Lower bits <1:0> are fixed.
	BUS_ADDR74	0b0011	Fixed value. SBADRI [7:4] bits also should match with this value to activate the IP.

## Synthesis Attribute

Synthesis attribute "I2C\_CLK\_DIVIDER" is used by PNR and STA tools for optimization and deriving the appropriate clock frequency at SCLO output with respect to the SBCLKI input clock frequency.

/\* synthesis I2C\_CLK\_DIVIDER=[Divide Range] \*/

Divide Range : 0, 1, 2, 3 ... 1023. Default is 0.

## Verilog Instantiation

```
SB_I2C i2cInst0 (
    .SBCLKI(sbc1ki),
    .SBRWI(sbrwi),
    .SBSTBI(sbstbi),

    .SDAOE(sdao)
)//* synthesis I2C_CLK_DIVIDER= 1 */;

defparam i2cInst0.I2C_SLAVE_INIT_ADDR = "0b1111100001";
defparam i2cInst0.BUS_ADDR74 = "0b0001";
```

## ***SB\_SPI***

The SPI hard IP provide industry standard four-pin communication interface with 8 bit wide System Bus to communicate with System Host. It could be configured as Master or Slave SPI port with separate Chip Select Pin. In master mode, it provides programmable baud rate, and supports CS HOLD capability for multiple transfers. It provides variety status flags, such as Mode Fault Error flag, Transmit/Receive status flag etc. for easy communicate with system host.

iCE40LM device supports two SPI hard IP primitives, located at lower left corner and lower right corner of the chip.

## Ports

SB_SPI Ports		
Signal Name	Direction	Description
SBCLKI	Input	System Clock input.
SBRWI	Input	System Read/Write Input.
SBSTBI	Input	Strobe Signal
SBADRI0	Input	System Bus Control registers address. Bit 0.
SBADRI1	Input	System Bus Control registers address. Bit 1.
SBADRI2	Input	System Bus Control registers address. Bit 2.
SBADRI3	Input	System Bus Control registers address. Bit 3.
SBADRI4	Input	System Bus Control registers address. Bit 4.
SBADRI5	Input	System Bus Control registers address. Bit 5.
SBADRI6	Input	System Bus Control registers address. Bit 6.
SBADRI7	Input	System Bus Control registers address. Bit 7.
SBDATI0	Input	System Data Input. Bit 0.
SBDATI1	Input	System Data input. Bit 1.
SBDATI2	Input	System Data input. Bit 2.
SBDATI3	Input	System Data input. Bit 3.
SBDATI4	Input	System Data input. Bit 4.
SBDATI5	Input	System Data input. Bit 5.
SBDATI6	Input	System Data input. Bit 6.
SBDATI7	Input	System Data input. Bit 7.
SBDATO0	Input	System Data Output. Bit 0.
SBDATO1	Input	System Data Output. Bit 1.
SBDATO2	Input	System Data Output. Bit 2.
SBDATO3	Input	System Data Output. Bit 3.
SBDATO4	Input	System Data Output. Bit 4.
SBDATO5	Input	System Data Output. Bit 5.
SBDATO6	Input	System Data Output. Bit 6.

SBDAT07	Input	System Data Output. Bit 7.
SBACKO	Output	System Acknowledgement
SPIIRQ	Output	SPI Interrupt output.
SPIWKUP	Output	SPI Wake Up from Standby signal.
MI	Input	Master Input from PAD
SO	Output	Slave Output to PAD
SOE	Output	Slave Output Enable to PAD. Active High.
SI	Input	Slave Input from PAD
MO	Output	Master Output to PAD
MOE	Output	Master Output Enable to PAD. Active High
SCKI	Input	Slave Clock Input From PAD
SCKO	Output	Slave Clock Output to PAD
SCKOE	Output	Slave Clock Output Enable to PAD. Active High.
SCSNI	Input	Slave Chip Select Input From PAD
MCSNO0	Output	Master Chip Select Output to PAD. Line 0.
MCSNO1	Output	Master Chip Select Output to PAD. Line 1.
MCSNO2	Output	Master Chip Select Output to PAD. Line 2.
MCSNO3	Output	Master Chip Select Output to PAD. Line 3.
MCSNOE0	Output	Master Chip Select Output Enable to PAD. Active High. Line 0.
MCSNOE1	Output	Master Chip Select Output Enable to PAD. Active High. Line 1
MCSNOE2	Output	Master Chip Select Output Enable to PAD. Active High. Line 2
MCSNOE3	Output	Master Chip Select Output Enable to PAD. Active High. Line 3

## Parameters

SPI Primitive requires configuring a parameter for selecting the SPI IP location.

I2C Location	Parameters	Parameter Default Value.	Description.
Lower Left Corner	BUS_ADDR74	0b0000	Fixed value. SBADRI [7:4] bits also should match with this value to activate the IP.
Lower Right Corner	BUS_ADDR74	0b0001	Fixed value. SBADRI [7:4] bits also should match with this value to activate the IP.

## Synthesis Attribute

Synthesis attribute “SPI\_CLK\_DIVIDER” is used by PNR and STA tools for optimization and deriving the appropriate clock frequency at SCKO output with respect to the SBCLKI input clock frequency.

/\* synthesis SPI\_CLK\_DIVIDER= [Divide Range] \*/

Divide Range : 0, 1, 2, 3....63. Default is 0.

## Verilog Instantiation

```
SB_SPI spiInst0 (
    .SBCLKI(sbc1ki),
    .SBRWI(sbrwi),

## iCE5LP (iCE40 Ultra) Hard Macros

This section describes the following dedicated hard macro primitives available in iCE5LP (iCE40 Ultra) devices.

SB\_HFOSC  
SB\_LFOSC  
SB\_LED\_DRV\_CUR  
SB\_RGB\_DRV  
SB\_IR\_DRV  
SB\_IO\_OD  
SB\_I2C  
SB\_SPI  
SB\_MAC16

### SB\_HFOSC

SB\_HFOSC primitive generates 48MHz nominal clock frequency within +/- 10% variation, with user programmable divider value of 1, 2, 4, and 8. The HFOSC can drive either the global clock network or fabric routes directly based on the clock network selection.

#### Ports

SB_HFOSC Ports		
Signal Name	Direction	Description
CLKHFPU	Input	Power up the HFOSC circuit. After power up, oscillator output will be stable after 100us. Active High.
CLKHFEN	Input	Enable the clock output. Enable should be low for the 100us power up period. Active High.
CLKHF	Output	HF Oscillator output.

#### Parameters

Parameter	Parameter Values.	Description.
CLKHF_DIV	"0b00"	Sets 48MHz HFOSC output.
	"0b01"	Sets 24MHz HFOSC output.
	"0b10"	Sets 12MHz HFOSC output.
	"0b11"	Sets 6MHz HFOSC output.

#### Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CLKHFEN: Logic "0"

Input CLKHFPU: Logic "0"

## Clock Network Selection

By default the oscillator use one of the dedicated clock networks in the device to drive the elements. The user may configure the oscillator to use the fabric routes instead of global clock network using the synthesis attribute.

## Synthesis Attributes

```
/* synthesis ROUTE_THROUGH_FABRIC = <value> */
```

Value:

0: Use dedicated clock network. Default option.

1: Use fabric routes.

## Verilog Instantiation

```
SB_HFOSC OSCInst0 (  
  .CLKHFEN(ENCLKHF),  
  .CLKHFPU(CLKHF_POWERUP),  
  .CLKHF(CLKHF)  
) /* synthesis ROUTE_THROUGH_FABRIC= [0|1] */;
```

```
defparam OSCInst0.CLKHF_DIV = "0b00";
```

## SB\_LFOSC

SB\_LFOSC primitive generates 10 KHz nominal clock frequency within +/- 10% variation. There is no divider on the LFOSC.

The LFOSC can drive either the global clock network or fabric routes directly based on the clock network selection

## Ports

SB_LFOSC Ports		
Signal Name	Direction	Description
CLKLFPU	Input	Power up the LFOSC circuit. After power up, oscillator output will be stable after 100us. Active High.
CLKLFEN	Input	Enable the clock output. Enable should be low for the 100us power up period. Active High.
CLKLF	Output	LF Oscillator output.

## Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CLKLFEN: Logic "0"

Input CLKLFPU: Logic "0"

## Clock Network Selection

By default the oscillator use one of the dedicated clock networks in the device to drive the elements. The user may configure the oscillator to use the fabric routes instead of global clock network using the synthesis attribute.

## Synthesis Attributes

```
/* synthesis ROUTE_THROUGH_FABRIC = <value> */
```

Value:

0: Use dedicated clock network. Default option.

1: Use fabric routes.

## Verilog Instantiation

```
SB_LFOSC OSCInst1 (  
    .CLKLFEN(ENCLKLF),  
    .CLKLFPU(CLKLF_POWERUP),  
    .CLKLF(CLKLF)  
) /* synthesis ROUTE_THROUGH_FABRIC= [0|1] */;
```

## SB\_LED\_DRV\_CUR

SB\_LED\_DRV\_CUR primitive generates the constant reference current required to power up the SB\_RGB\_DRV and SB\_IR\_DRV primitives.

## Ports

SB_LED_DRV_CUR Ports		
Signal Name	Direction	Description
EN	Input	Enable to generate constant current source for SB_RGB_DRV and SB_IR_DRV primitives. After Enable, reference current value will be stable after 100us. Active High.
LEDPU	Output	Power up signal for SB_RGB_DRV and SB_IR_DRV primitives. This port should be connected only to RGBPU/IRPU pins of SB_RGB_DRV and SB_IR_DRV primitives.

## Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input EN : Logic "0"

## Verilog Instantiation

```
SB_LED_DRV_CUR    LED_CUR_inst
(
    .EN(enable_led_current),
    .LEDPU(led_power_up)
);
```

## SB\_RGB\_DRV

SB\_RGB\_DRV primitive contains 3 dedicated open drain I/O pins for RGB LED outputs. Each of the RGB LED output is bonded out together with an SB\_IO\_OD primitive to the package pin. User can either use SB\_RGB\_DRV primitive or the SB\_IO\_OD primitive to drive the package pin, but not both.

The primitive allows configuration of each of the 3 RGB LED outputs individually. When the RGBx\_CURRENT parameter of RGBx output is set to "0b000000", then SB\_IO\_OD can be used to drive the package pin.

## Ports

SB_RGB_DRV Ports		
Signal Name	Direction	Description
RGBLEDEN	Input	Enable the SB_RGB_DRV primitive. Active High.
RGBPU	Input	Power Up Signal. Connect to LEDPU port of SB_LED_DRV_CUR primitive.
RGB0PWM	Input	Input data to drive RGB0 LED pin. This input is usually driven from the SB_LEDD_IP.
RGB1PWM	Input	Input data to drive RGB1 LED pin. This input is usually driven from the SB_LEDD_IP.
RGB2PWM	Input	Input data to drive RGB2 LED pin. This input is usually driven from the SB_LEDD_IP.
RGB0	Output	RGB0 LED output.
RGB1	Output	RGB1 LED output.
RGB2	Output	RGB2 LED output.

## Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input RGBLEDEN : Logic "0"  
 Input RGB0PWM : Logic "0"  
 Input RGB1PWM : Logic "0"

Input RGB2PWM : Logic "0"  
Input RGBPU : Logic "0"

## Parameters

The SB\_RGB\_DRV primitive contains the following parameter and their default values:

Parameter RGB0\_CURRENT = "0b000000";  
Parameter RGB1\_CURRENT = "0b000000";  
Parameter RGB2\_CURRENT = "0b000000";

Parameter values:

"0b000000" = 0mA. // Set this value to use the associated SB\_IO\_OD instance at RGB  
// LED location.

"0b000001" = 4mA.

"0b000011" = 8mA.

"0b000111" = 12mA.

"0b001111" = 16mA.

"0b011111" = 20mA.

"0b111111" = 24mA.

## Verilog Instantiation

```
SB_RGB_DRV RGB_DRIVER (  
    .RGBLEDEN(ENABLE_LED),  
    .RGB0PWM(RGB0),  
    .RGB1PWM(RGB1),  
    .RGB2PWM(RGB2),  
    .RGBPU(led_power_up),  
    .RGB0(LED0),  
    .RGB1(LED1),  
    .RGB2(LED2)  
);  
  
defparam RGB_DRIVER.RGB0_CURRENT = "0b111111";  
defparam RGB_DRIVER.RGB1_CURRENT = "0b111111";  
defparam RGB_DRIVER.RGB2_CURRENT = "0b111111";
```

## SB\_IR\_DRV

SB\_IR\_DRV primitive contains a single dedicated open drain I/O pin for IRLED output. The IRLED output is bonded out together with an SB\_IO\_OD primitive to the package pin. User can either use SB\_IR\_DRV primitive or the SB\_IO\_OD primitive to drive the package pin, but not both.

When the IR\_CURRENT parameter is set to "0b0000000000", then SB\_IO\_OD can be used to drive the package pin.

## Ports

SB_IR_DRV Ports		
Signal Name	Direction	Description
IRLEDEN	Input	Enable the SB_IR_DRV primitive. Active High.
IRPU	Input	Power Up Signal. Connect to LEDPU port of SB_LED_DRV_CUR primitive.
IRPWM	Input	PWM Input data to drive IRLED pin.
IRLED	Output	IR LED output.

## Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input IRLEDEN : Logic "0"  
Input IRPWM : Logic "0"

## Parameter

The SB\_IR\_DRV primitive contains the following parameter and their default values:

Parameter IR\_CURRENT = "0b0000000000";

Parameter Values:

```
"0b0000000000"; = 0mA. // Set this value to use the associated SB_IO_OD instance at
                        // IR LED location.
"0b0000000001"; = 50mA
"0b0000000011"; = 100mA
"0b0000000111"; = 150mA
"0b0000001111"; = 200mA
"0b0000011111"; = 250mA
"0b0000111111"; = 300mA
"0b0001111111"; = 350mA
"0b0011111111"; = 400mA
"0b0111111111"; = 450mA
"0b1111111111"; = 500mA
```

## Verilog Instantiation

```
SB_IR_DRV  IRDRVinst (
    .IRLEDEN(ENABLE_IRLED),
    .IRPWM(IR_INPUT),
    .IRPU(led_power_up),
    .IRLED(IR_LED)
);
defparam IRDRVinst.IR_CURRENT = "0b1111111111";
```

## SB\_RGB\_IP

SB\_RGB\_IP primitive generates the 3 RGB PWM outputs, to be connected to the LED drivers.

### Ports

SB_RGB_IP Ports		
Signal Name	Direction	Description
CLK	Input	Clock Input.
RST	Input	Asynchronous Reset Input.
PARAMSOK	Input	Enable signal to sample the rgb data.
RGBCOLOR[3:0]	Input	4 bit rgb color data input
BRIGHTNESS[3:0]	Input	4 bit rgb brightness data input
BREATHRAMP[3:0]	Input	4 bit breathramp data input
BLINKRATE[3:0]	Input	4 bit blinkrate data input
REDPWM	Output	RED PWM output.
GREENPWM	Output	GREEN PWM output.
BLUEPWM	Output	BLUE PWM output.

### Default Signal Values

The iCEcube2 software assigns the logic “0” value to all unconnected input ports.

### Verilog Instantiation

```

SB_RGB_IP RGBPWMIP_inst(
    .CLK (CLK),
    .RST (RST),                      // Async rst
    .PARAMSOK (PARAMSOK),
    .RGBCOLOR (RGBCOLOR),
    .BRIGHTNESS (BRIGHTNESS),
    .BREATHRAMP (BREATHRAMP),
    .BLINKRATE (BLINKRATE),
    .REDPWM (REDPWM),
    .GREENPWM (GREENPWM),
    .BLUEPWM (BLUEPWM)
);
  
```

***SB IO OD***

The SB\_IO\_OD is the open drain IO primitive. When the Tristate output is enabled, the IO pulls down the package pin signal to zero. The following figure and Verilog template illustrate the complete user accessible logic diagram, and its Verilog instantiation.

## Ports

SB_IO_OD Ports		
Signal Name	Direction	Description
PACKAGEPIN	Bidirectional	Bidirectional IO pin.
LATCHINPUTVALUE	Input	Latches/Holds the input data.
CLOCKENABLE	Input	Clock enable signal.
INPUTCLK	Input	Clock for the input registers.
OUTPUTCLK	Input	Clock for the output registers.
OUTPUTENABLE	Input	Enable Tristate output. Active high.
DOUT0	Input	Data to package pin.
DOUT1	Input	Data to package pin.
DIN0	Output	Data from package pin.
DIN1	Output	Data from package pin.

## Default Signal Values

The iCEcube2 software assigns the logic “0” value to all unconnected input ports except for CLOCKENABLE.

Note that explicitly connecting logic “1” value to port CLOCKENABLE will result in a non-optimal implementation, since extra LUT will be used to generate the Logic “1”. If the user’s intention is to keep the Input and Output registers always enabled, it is recommended that port CLOCKENABLE to be left unconnected.

## Parameter Values

```
Parameter PIN_TYPE = 6'b000000;  
                                // See Input and Output Pin Function Tables in SB_IO.  
                                // Default value of PIN_TYPE = 6'b000000  
Parameter NEG_TRIGGER = 1'b0;  
                                // Specify the polarity of all FFs in the I/O to be falling edge when  
                                NEG_TRIGGER = 1. Default is 1'b0, rising edge.
```

## Input and Output Pin Function Tables

Refer SB\_IO Input and Output Pin Functional Table for the PIN\_TYPE settings. Some of the output pin configurations are not applicable for SB\_IO\_OD primitive.

## Verilog Instantiation

```
SB_IO_OD    OpenDrainInst0  
(  
  .PACKAGEPIN (PackagePin),           // User's Pin signal name  
  .LATCHINPUTVALUE (latchinputvalue), // Latches/holds the Input value  
  .CLOCKENABLE (clockenable),          // Clock Enable common to input and  
                                        // output clock  
  .INPUTCLK (inputclk),                // Clock for the input registers  
  .OUTPUTCLK (outputclk),              // Clock for the output registers  
  .OUTPUTENABLE (outputenable),        // Output Pin Tristate/Enable  
                                        // control  
  .DOUT0 (dout0),                     // Data 0 - out to Pin/Rising clk  
                                        // edge

defparam OpenDrainInst0.NEG_TRIGGER = 1'b0;
```

## SB\_I2C

iCE5LP device supports two I2C hard IP primitives , located at upper left corner and upper right corner of the chip.

## Ports

The port interface is similar as iCE40LM SB\_I2C primitive. Refer Page 113.

## Parameters

The parameters are same as ICE40LM SB\_I2C primitive.

## Synthesis Attribute

### I2C\_CLK\_DIVIDER

Synthesis attribute "I2C\_CLK\_DIVIDER" is used by PNR and STA tools for optimization and deriving the appropriate clock frequency at SCLO output with respect to the SBCLKI input clock frequency.

```
/* synthesis I2C_CLK_DIVIDER= Divide Value */
```

Divide Value: 0, 1, 2, 3 ... 1023. Default is 0.

### SDA\_INPUT\_DELAYED

SDA\_INPUT\_DELAYED attribute is used to add 50ns additional delay to the SDAI signal.

```
/* synthesis SDA_INPUT_DELAYED= value */
```

Value:

- 0: No delay.
- 1: Add 50ns delay. (Default value).

## SDA\_OUTPUT\_DELAYED

SDA\_OUTPUT\_DELAYED attribute is used to add 50ns additional delay to the SDAO signal.

```
/* synthesis SDA_OUTPUT_DELAYED= value */
```

Value:

- 0: No delay (Default value).
- 1: Add 50ns delay.

## SB\_SPI

iCE5LP device supports two SPI hard IP primitives, located at lower left corner and lower right corner of the chip. The port interface of SB\_SPI is similar as ICE40LM SB\_SPI primitive. Refer Page 116.

## Ports

The port interface is similar as iCE40LM SB\_SPI primitive. Refer Page 116.

## Parameters

The parameters are same as ICE40LM SB\_SPI primitive.

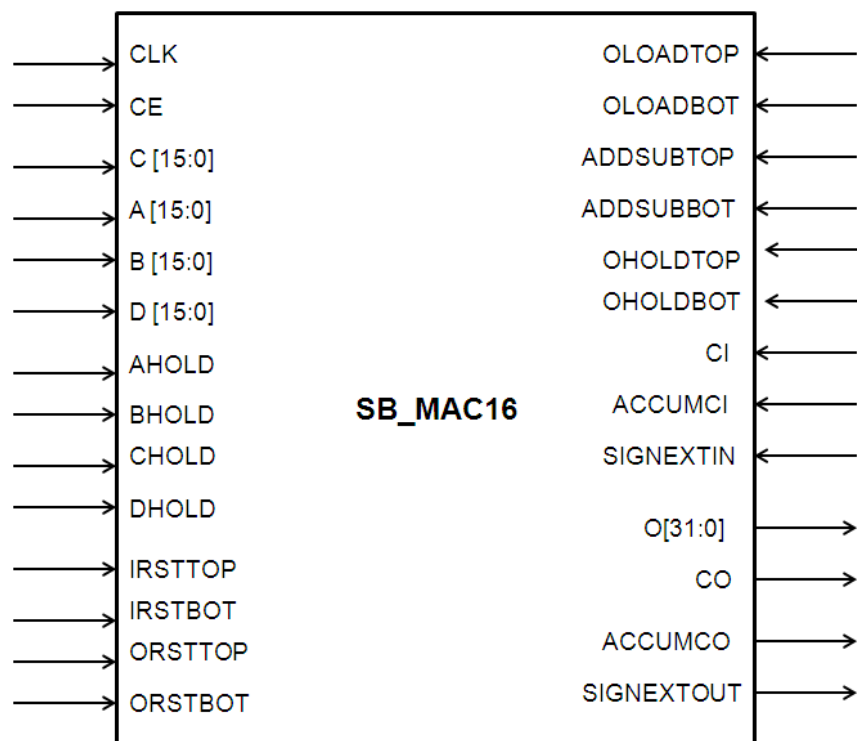

## Synthesis Attribute

The synthesis attribute is same as ICE40LM SB\_SPI primitive.

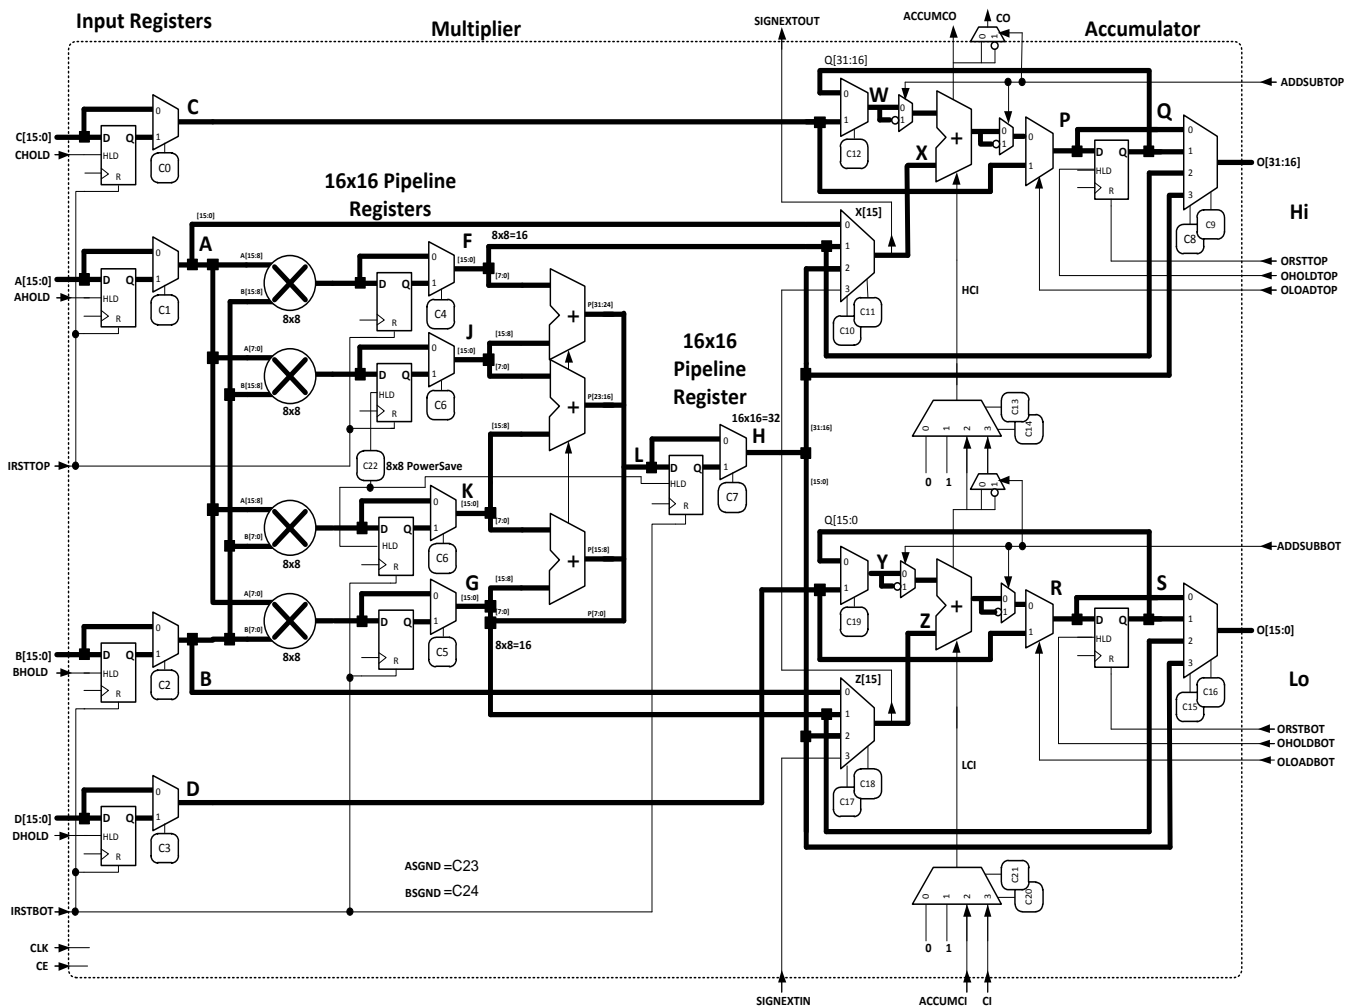

## SB\_MAC16

The SB\_MAC16 primitive is the dedicated configurable DSP block available in iCE5LP devices. The SB\_MAC16 can be configured into a multiplier, adder, subtracter, accumulator, multiply-add and multiply-sub through the instance parameters. The SB\_MAC16 blocks can be cascaded to implement wider functional units.

iCEcube2 supports a set of predefined SB\_MAC16 functional configurations. Refer Page 137 for the list of supported configurations.

SB\_MAC16 Interface Diagram

SB\_MAC16 Functional Model

## Ports

SB_MAC16 Ports			
Signal Name	Direction	Description	Default Values
CLK	Input	Clock input. Applies to all clocked elements in the MAC16 Block.	
CE	Input	Clock Enable Input. Active High.	1'b1
C[15:0]	Input	Input to the C Register / Direct input to the adder accumulator.	16'b0
A[15:0]	Input	Input to the A Register / Direct input to the multiplier blocks /Direct input to the adder accumulator.	16'b0
B[15:0]	Input	Input to the B Register / Direct input to the multiplier blocks /Direct input to the adder accumulator.	16'b0
D[15:0]	Input	Input to the D Register / Direct input to the adder accumulator.	16'b0
AHOLD	Input	Hold A registers Data .Controls data flow into the input register A. Active High.	1'b0
0 Update (load) register at next active clock edge.			

		1	Hold (retain) current register value, regardless of clock.	
BHOLD	Input	Hold B registers Data .Controls data flow into the B input register. Active High.		1'b0
		0	Update (load) register at next active clock edge.	
		1	Hold (retain) current register value, regardless of clock.	
CHOLD	Input	Hold C registers Data. Controls data flow into the A input register. Active High.		1'b0
		0	Update (load) register at next active clock edge.	
		1	Hold (retain) current register value, regardless of clock.	
DHOLD	Input	Hold D registers Data. Controls data flow into the A input register. Active High.		1'b0
		0	Update (load) register at next active clock edge.	
		1	Hold (retain) current register value, regardless of clock.	
IRSTTOP	Input	Reset input to the A and C input registers, and the pipeline registers in the upper half of the multiplier block. Active High		1'b0
IRSTBOT	Input	Reset input to the B and C input registers, and the pipeline registers in the lower half of the multiplier block, and the 32-bit multiplier result pipeline register. Active High.		1'b0
ORSTTOP	Input	Reset the high-order bits of the accumulator register ([31:16]). Active High.		1'b0
ORSTBOT	Input	Reset the low-order accumulator register bits ([15:0]). Active High.		1'b0
OLOADTOP	Input	High-order Accumulator Register Accumulate/Load. Controls whether the accumulator register accepts the output of the adder/subtractor or whether the register is loaded with the value from Input C (or Register C, if configured).		1'b0
		0	Accumulator Register [31:16] loaded with output from adder/subtractor.	
		1	Accumulator Register [31:16] loaded with Input C or Register C, depending on primitive parameter value.	
OLOADBOT	Input	Low-order Accumulator Register Accumulate/Load. Controls whether the low-order accumulator register bits (15:0] accepts the output of the adder/subtractor or whether the register is loaded with the value from Input D (or Register D, if configured).		1'b0
		0	Accumulator Register [15:0] loaded with output from adder/subtractor.	
		1	Accumulator Register [15:0] loaded with Input D or Register D, depending on primitive parameter value.	
ADDSUBTOP	Input	High-order Add/Subtract. Controls whether the adder/subtractor adds or subtracts.		1'b0: Add
		0	Add: W+X+HCI	
		1	Subtract: W-X-HCI	
ADDSUBBOT	input	Low-order Add/Subtract. Controls whether the adder/subtractor adds or subtracts.		1'b0: Add

		0	Add: Y+Z+LCI	
		1	Subtract: Y-Z-LCI	
OHOLDTOP	Input	High-order Accumulator Register Hold. Controls data flow into the high-order ([31:16]) bits of the accumulator.		
		0	Update (load) register at next active clock edge.	
		1	Hold (retain) current register value, regardless of clock.	
OHOLDBOT	Input	Low-order Accumulator Register Hold. Controls data flow into the high-order ([15:0]) bits of the accumulator.		
		0	Update (load) register at next active clock edge.	
		1	Hold (retain) current register value, regardless of clock.	
CI	Input	Carry/borrow input from lower logic tile.		
ACCUMCI	Input	Cascade Carry/borrow input from lower MAC16 block.		
SIGNEXTIN	Input	Sign extension input from lower MAC16 block.		
O[31:0]	Output	32 bit MAC16 Output.		
		O[31:0]	32-bit result of a 16x16 multiply operation or a 32-bit adder/accumulate function.	
		O[31:16]	16-bit result of an 8x8 multiply operation or a 32-bit adder/accumulate function.	
		O[15:0]	16-bit result of an 8x8 multiply operation or a 32-bit adder/accumulate function.	
CO	Output	Carry/borrow output to higher logic tile.		
ACCUMCO	Output	Cascade Carry/borrow output to higher MAC16 block.		
SIGNEXTOUT	Output	Sign extension output to higher MAC16 block.		

## Parameters

The parameter table below shows the list of parameters to configure the SB\_MAC16 block. This table also maps the parameter to the configuration bits shown in the SB\_MAC16 Functional diagram.

Parameter Name	Configuration bits	Parameter Description	Parameter Values	Description
NEG_TRIGGER		Controls input clock polarity	0	All the registers are rising_edge triggered.
			1	All the registers are falling_edge triggered.
C_REG	C0	Input C register Control.	0	Input C not registered
			1	Input C registered
A_REG	C1	Input A register Control	0	Input A not registered
			1	Input A registered
B_REG	C2	Input B register Control	0	Input B not registered
			1	Input B registered
D_REG	C3	Input D register Control	0	Input D not registered
			1	Input D registered
TOP_8x8_MULT_REG	C4	Top 8x8 multiplier output register control (point F)	0	Top 8x8 multiplier output is not registered.
			1	Top 8x8 multiplier output is registered.
BOT_8x8_MULT_REG	C5	Bottom 8x8 multiplier	0	Bottom 8x8 multiplier

		output register control. (point G)		output is not registered.
			1	Bottom 8x8 multiplier output is registered
PIPELINE_16x16_MULT_REG1	C6	Intermediate 8x8 multiplier pipeline register controls (points J and K). These multipliers are only used for 16x16 multiply operations. For 8x8 multiply operations, set C6 and C7 to 1, which reduces power consumption.	0	Intermediate 8x8 multiplier outputs are not registered.
			1	Intermediate 8x8 multiplier outputs are registered.
PIPELINE_16x16_MULT_REG2	C7	16x16 multiplier Pipeline registers control. (point H)	0	32-bit output from 16x16 multiplier is not registered.
			1	32-bit output from 16x16 multiplier is registered.
TOPOUTPUT_SELECT	C9,C8	Selects Top SB_MAC16 output O[31:16].	00	16-bit output of Multiplexer P, from top adder/subtractor,
			01	16-bit output from upper accumulator register, Q
			10	16-bit output from upper 8x8 multiplier, F
			11	Upper 16-bit output from 16x16 multiplier, H
TOPADDSUB_LOWERINPUT	C11,C10	Selects input X for the upper adder/subtractor	00	16-bit input from A input or associated input register.
			01	16-bit output from upper 8x8 multiplier, F
			10	Upper 16-bit output from 16x16 multiplier, H
			11	Sign extension input from lower adder/subtractor, Z[15]. Duplicate 16 bits.
TOPADDSUB_UPPERINPUT	C12	Selects input W for the upper adder/subtractor	0	16-bit feedback from upper accumulator register, Q
			1	16-bit input from C input or associated pipeline register
TOPADDSUB_CARRYSELECT	C14,C13	Carry/borrow input select to upper adder/subtractor.	00	Constant 0
			01	Constant 1
			10	Cascade Carry/borrow output from lower adder/subtractor
			11	Carry/borrow output from lower adder/subtractor
BOTOUTPUT_SELECT	C16,C15	Selects Lower SB_MAC16 output O[15:0].	00	16-bit output of multiplexer R from lower adder/subtractor
			01	16-bit output from lower accumulator register, S
			10	16-bit output from lower 8x8

				multiplier, G
			11	Lower 16-bit output from 16x16 multiplier, H
BOTADDSUB_LOWERINPUT	C18,C17	Selects Input Z for the lower adder/subtractor	00	16-bit input from B input or associated pipeline register
			01	16-bit output from lower 8x8 multiplier, G
			10	Lower 16-bit output from 16x16 multiplier, H
			11	Sign extension input SIGNEXTIN. Duplicate 16 bits.
BOTADDSUB_UPPERINPUT	C19	Selects Input Y for the lower adder/subtractor	0	16-bit feedback from lower accumulator register, S
			1	16-bit input from D input or associated input register.
BOTADDSUB_CARRYSELECT	C21,C20	Carry/borrow input select to lower adder/subtractor	00	Constant 0
			01	Constant 1
			10	Cascade Carry/borrow input from ACCUMCI
			11	Carry/borrow input from CI
MODE_8x8	C22	Selects 8x8 Multiplier mode and 8x8 Low-Power Multiplier Blocking Option	0	No effect
			1	Selects 8x8 Multiplier mode. Holds the pipelining registers associate with a 16x16 multiplier in clock disable mode. Helps reduce the dynamic power consumption within the multiplier function. Used in conjunction with C6, C7 settings.
A_SIGNED	C23	Indicates whether multiplier input A is signed or unsigned. Applies regardless if input A is 16-or 32-bits wide.	0	Multiplier input A is unsigned.
			1	Multiplier input A is signed.
B_SIGNED	C24	Indicates whether multiplier input B is signed or unsigned. Applies regardless if input B is 16-or 32-bits wide.	0	Multiplier input B is unsigned.
			1	Multiplier input B is signed.

## SB\_MAC16 Configurations

The following SB\_MAC16 functional blocks are supported in iCEcube2.

1. Multiplier.
2. Multiply and Accumulate (MAC).
3. Accumulator (ACC).
4. Add/Subtract (ADD/SUB).
5. Multiply and Add/Subtract (MULTADDSUB)

The valid configuration parameter settings for each functional block are listed below.

**Note:** Read the configuration settings from left to right while filling the SB\_MAC16 instance parameter values.

**Table 1 : Multiplier Configurations**

8x8 Multiplier : 8x8 input multiplier with 16 bit output.

16x16 Multiplier: 16x16 input multiplier with 32 bit output.

## iCE40UL (iCE40 Ultra Lite) Hard Macros

This section describes the following dedicated hard macro primitives available in iCE40UL device.

SB\_HFOSC  
SB\_LFOSC  
SB\_RGBA\_DRV  
SB\_IR400\_DRV  
SB\_BARCODE\_DRV  
SB\_IR500\_DRV  
SB\_LEDDA\_IP  
SB\_IR\_IP  
SB\_IO\_OD  
SB\_I2C\_FIFO

### SB\_HFOSC

SB\_HFOSC primitive generates 48MHz nominal clock frequency within +/- 10% variation, with user programmable divider value of 1, 2, 4, and 8. The HFOSC can drive either the global clock network or fabric routes directly based on the clock network selection.

#### Ports

SB_HFOSC Ports		
Signal Name	Direction	Description
CLKHFPU	Input	Power up the HFOSC circuit. After power up, oscillator output will be stable after 100us. Active High.
CLKHFEN	Input	Enable the clock output. Enable should be low for the 100us power up period. Active High.
CLKHF	Output	HF Oscillator output.

#### Parameters

Parameter	Parameter Values.	Description.
CLKHF_DIV	"0b00"	Sets 48MHz HFOSC output.
	"0b01"	Sets 24MHz HFOSC output.
	"0b10"	Sets 12MHz HFOSC output.
	"0b11"	Sets 6MHz HFOSC output

#### Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CLKHFEN: Logic "0"

Input CLKHFPU: Logic "0"

## Clock Network Selection

By default the oscillator use one of the dedicated clock networks in the device to drive the elements. The user may configure the oscillator to use the fabric routes instead of global clock network using the synthesis attribute.

## Synthesis Attributes

```
/* synthesis ROUTE_THROUGH_FABRIC = <value> */
```

Value:

0: Use dedicated clock network. Default option.

1: Use fabric routes.

## Verilog Instantiation

```
SB_HFOSC OSCInst0 (  
  .CLKHFEN(ENCLKHF),  
  .CLKHFPU(CLKHF_POWERUP),  
  .CLKHF(CLKHF)  
) /* synthesis ROUTE_THROUGH_FABRIC= [0|1] */;
```

```
defparam OSCInst0.CLKHF_DIV = "0b00";
```

## SB\_LFOSC

SB\_LFOSC primitive generates 10 KHz nominal clock frequency within +/- 10% variation. There is no divider on the LFOSC.

The LFOSC can drive either the global clock network or fabric routes directly based on the clock network selection

## Ports

SB_LFOSC Ports		
Signal Name	Direction	Description
CLKLFPU	Input	Power up the LFOSC circuit. After power up, oscillator output will be stable after 100us. Active High.
CLKLFEN	Input	Enable the clock output. Enable should be low for the 100us power up period. Active High.
CLKLF	Output	LF Oscillator output.

## Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CLKLFEN: Logic "0"

Input CLKLFPU: Logic "0"

## Clock Network Selection

By default the oscillator use one of the dedicated clock networks in the device to drive the elements. The user may configure the oscillator to use the fabric routes instead of global clock network using the synthesis attribute.

## Synthesis Attributes

```
/* synthesis ROUTE_THROUGH_FABRIC = <value> */
```

Value:

0: Use dedicated clock network. Default option.

1: Use fabric routes.

## Verilog Instantiation

```
SB_LFOSC OSCInst1 (  
    .CLKLFEN(ENCLKLF),  
    .CLKLFPU(CLKLF_POWERUP),  
    .CLKLF(CLKLF)  
) /* synthesis ROUTE_THROUGH_FABRIC= [0|1] */;
```

## SB\_RGBA\_DRV

SB\_RGBA\_DRV primitive is the RGB LED drive module which contains 3 dedicated open drain I/O pins for RGB LED outputs. Each of the RGB LED output is bonded out together with an SB\_IO\_OD primitive to the package pin. User can either use SB\_RGBA\_DRV primitive or the SB\_IO\_OD primitive to drive the package pin, but not both.

The primitive allows configuration of each of the 3 RGB LED outputs individually. When the RGBx\_CURRENT parameter of RGBx output is set to "0b000000", then SB\_IO\_OD can be used to drive the package pin.

## Ports

SB_RGBA_DRV Ports		
Signal Name	Direction	Description
CURREN	Input	Enable the mixed signal control block to supply reference current to the IR drivers. When it is not enabled (CURREN=0), no current is supplied, and the IR drivers are powered down. Enabling the mixed signal control block takes 100us to reach a stable reference current value.
RGBLEDEN	Input	Enable the SB_RGBA_DRV primitive. Active High.
RGB0PWM	Input	Input data to drive RGB0 LED pin. This input is usually driven from the SB_LEDD_IP.
RGB1PWM	Input	Input data to drive RGB1 LED pin. This input is usually

		driven from the SB_LEDD_IP.
RGB2PWM	Input	Input data to drive RGB2 LED pin. This input is usually driven from the SB_LEDD_IP.
RGB0	Output	RGB0 LED output.
RGB1	Output	RGB1 LED output.
RGB2	Output	RGB2 LED output.

## Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CURREN : Logic "0"  
Input RGBLEDEN : Logic "0"  
Input RGB0PWM : Logic "0"  
Input RGB1PWM : Logic "0"  
Input RGB2PWM : Logic "0"

## Parameters

The SB\_RGBA\_DRV primitive contains the following parameter and their default values:

Parameter CURRENT\_MODE = "0b0 ";

Parameter values:

"0b0" = Full Current Mode (Default).

"0b1" = Half Current Mode.

Parameter RGB0\_CURRENT = "0b000000";

Parameter RGB1\_CURRENT = "0b000000";

Parameter RGB2\_CURRENT = "0b000000";

Parameter values:

"0b000000" = 0mA. // Set this value to use the associated SB\_IO\_OD instance at RGB  
// LED location.

"0b000001" = 4mA for Full Mode; 2mA for Half Mode

"0b000011" = 8mA for Full Mode; 4mA for Half Mode

"0b000111" = 12mA for Full Mode; 6mA for Half Mode.

"0b001111" = 16mA for Full Mode; 8mA for Half Mode

"0b011111" = 20mA for Full Mode; 10mA for Half Mode.

"0b111111" = 24mA for Full Mode; 12mA for Half Mode.

## Verilog Instantiation

```
SB_RGBA_DRV RGBA_DRIVER (
    .CURREN(ENABLE_CURR),
    .RGBLEDEN(ENABLE_RGBDRV),
    .RGB0PWM(RGB0),
    .RGB1PWM(RGB1),
    .RGB2PWM(RGB2),
    .RGB0(LED0),
    .RGB1(LED1),
    .RGB2(LED2)
);

defparam RGBA_DRIVER.CURRENT_MODE = "0b0";
defparam RGBA_DRIVER.RGB0_CURRENT = "0b111111";
defparam RGBA_DRIVER.RGB1_CURRENT = "0b111111";
defparam RGBA_DRIVER.RGB2_CURRENT = "0b111111";
```

## SB\_IR400\_DRV

SB\_IR400\_DRV primitive is the IR driver which contains a single dedicated open drain I/O pin for IRLED output. The IRLED output is bonded out together with an SB\_IO\_OD primitive to the package pin. User can either use SB\_IR400\_DRV primitive or the SB\_IO\_OD primitive to drive the package pin, but not both.

When the IR400\_CURRENT parameter is set to "0b00000000", then SB\_IO\_OD can be used to drive the package pin.

### Ports

SB_IR400_DRV Ports		
Signal Name	Direction	Description
CURREN	Input	Enable the mixed signal control block to supply reference current to the IR drivers. When it is not enabled (CURREN=0), no current is supplied, and the IR drivers are powered down. Enabling the mixed signal control block takes 100us to reach a stable reference current value.
IRLEDEN	Input	Enable the SB_IR400_DRV primitive. Active High.
IRPWM	Input	PWM Input data to drive IRLED pin.
IRLED	Output	IR LED output.

### Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CURREN : Logic "0"  
Input IRLEDEN : Logic "0"  
Input IRPWM : Logic "0"

### Parameter

The SB\_IR400\_DRV primitive contains the following parameter and their default values:

Parameter CURRENT\_MODE = "0b0 ";

Parameter values:

"0b0" = Full Current Mode (Default).

"0b1" = Half Current Mode.

Parameter IR400\_CURRENT = "0b00000000";

Parameter Values:

"0b0000000000"; = 0mA. //This is the setting to tristate the IR output to allow it to be used as GPIO (SB\_IO\_OD)

"0b000000001"; = 50mA for Full Mode; 25mA for Half Mode.

"0b000000011"; = 100mA for Full Mode; 50mA for Half Mode.

"0b000000111"; = 150mA for Full Mode; 75mA for Half Mode.

"0b000001111"; = 200mA for Full Mode; 100mA for Half Mode.

"0b000111111"; = 250mA for Full Mode; 125mA for Half Mode.

"0b001111111"; = 300mA for Full Mode; 150mA for Half Mode.

"0b011111111"; = 350mA for Full Mode; 175mA for Half Mode.

"0b11111111"; = 400mA for Full Mode; 200mA for Half Mode.

## Verilog Instantiation

```
SB_IR400_DRV IRDRVinst (
    .CURREN(ENABLE_CURRENT),
    .IRLEDEN(ENABLE_IRDRV),
    .IRPWM(IR_PWMINPUT),
    .IRLED(IR_LEDOUT)
);
defparam IRDRVinst.CURRENT_MODE = "0b0";
defparam IRDRVinst.IR400_CURRENT = "0b1111111111";
```

## SB\_BARCODE\_DRV

SB\_BARCODE\_DRV primitive contains a single dedicated open drain I/O pin for BARCODE output. The BARCODE output is bonded out together with an SB\_IO\_OD primitive to the package pin. User can either use SB\_BARCODE\_DRV primitive or the SB\_IO\_OD primitive to drive the package pin, but not both.

When the BARCODE\_CURRENT parameter is set to "0b0000", SB\_IO\_OD can be used to drive the package pin.

## Ports

SB_BARCODE_DRV Ports		
Signal Name	Direction	Description
CURREN	Input	Enable the mixed signal control block to supply reference current to the IR drivers. When it is not enabled (CURREN=0), no current is supplied, and the IR drivers are powered down. Enabling the mixed signal control block takes 100us to reach a stable reference current value.
BARCODEN	Input	Enable the SB_BARCODE_DRV primitive. Active High.
BARCODEPWM	Input	PWM Input data to drive BARCODE pin.
BARCODE	Output	BARCODE output.

## Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CURREN : Logic "0"  
 Input BARCODEEN : Logic "0"  
 Input BARCODEPWM : Logic "0"

## Parameter

The SB\_BARCODE\_DRV primitive contains the following parameter and their default values:

Parameter CURRENT\_MODE = "0b0";

Parameter values:

"0b0" = Full Current Mode (Default).

"0b1" = Half Current Mode.

Parameter BARCODE\_CURRENT = "0b0000";

Parameter values:

"0b0000" = 0mA. //This is the setting to tristate the BARCODEoutput to allow it to be used  
// as GPIO (SB\_IO\_OD)

"0b0001" = 16.6mA for Full Mode; 8.3mA for Half Mode,

"0b0011" = 33.3mA for Full Mode; 16.6mA for Half Mode,

"0b1001" = 66.6mA for Full Mode; 33.3mA for Half Mode,

"0b1010" = 83.3mA for Full Mode; 41.6mA for Half Mode,

"0b0111" = 50mA for Full Mode; 25mA for Half Mode,

"0b1111" = 100mA for Full Mode; 50mA for Half Mode

## Verilog Instantiation

```
SB_BARCODE_DRV BARCODEDRVinst (  
    .CURREN(ENABLE_CURRENT),  
    .BARCODEEN(ENABLE_BARCODEDRV),  
    .BARCODEPWM(BARCODE_PWMINPUT),  
    .BARCODE(BARCODEOUT)  
);  
  
defparam BARCODEDRVinst.CURRENT_MODE = "0b0";  
defparam BARCODEDRVinst.BARCODE_CURRENT = "0b1111";
```

## SB\_IR500\_DRV

SB\_IR500\_DRV primitive is the IR driver which contains a two dedicated open drain I/O pin for IRLED1, IRLED2 outputs. The IRLED outputs are bonded out together with an SB\_IO\_OD primitive to the package pin. User can either use SB\_IR500\_DRV primitive or the SB\_IO\_OD primitive to drive the package pin, but not both.

When the IR4500\_CURRENT parameter is set to "0b00000000", then SB\_IO\_OD can be used to drive the package pin.

## SB\_IR500\_DRV DRC Rule

This primitive cannot be instantiated along with SB\_BARCODE\_DRV or SB\_IR400\_DRV instance.

## Ports

SB_IR500_DRV Ports		
Signal Name	Direction	Description
CURREN	Input	Enable the mixed signal control block to supply reference current to the IR drivers. When it is not enabled (CURREN=0), no current is supplied, and the IR drivers are powered down. Enabling the mixed signal control block takes 100us to reach a stable reference current value.
IRLEDEN	Input	Enable the SB_IR400_DRV primitive. Active High.
IRPWM	Input	PWM Input data to drive IRLED pin.
IRLED1	Output	IR LED output 1.
IRLED2	Output	IR LED output 2.

## Default Signal Values

The iCEcube2 software assigns the following signal value to unconnected port:

Input CURREN : Logic "0"

Input IRLEDEN : Logic "0"

Input IRPWM : Logic "0"

## Parameter

The SB\_IR500\_DRV primitive contains the following parameter and their default values:

Parameter CURRENT\_MODE = "0b0";

Parameter values:

"0b0"; = Full Current Mode (Default).

"0b1"; = Half Current Mode.

Parameter IR500\_CURRENT = "0b000000000000";

Parameter values:

"0b000000000000"; = 0mA. // This is the setting to tristate the BARCODE output to allow it to  
// be used as GPIO (SB\_IO\_OD).

"0b000000000111"; = 50mA for Full Mode; 25mA for Half Mode.

"0b000000001111"; = 100mA for Full Mode; 50mA for Half Mode.

"0b000000011111"; = 150mA for Full Mode; 75mA for Half Mode.

"0b000000111111"; = 200mA for Full Mode; 100mA for Half Mode.

"0b000001111111"; = 250mA for Full Mode; 125mA for Half Mode.

"0b000011111111"; = 300mA for Full Mode; 150mA for Half Mode.

"0b000111111111"; = 350mA for Full Mode; 175mA for Half Mode.

"0b001111111111"; = 400mA for Full Mode; 200mA for Half Mode.

"0b011111111111"; = 450mA for Full Mode; 225mA for Half Mode.

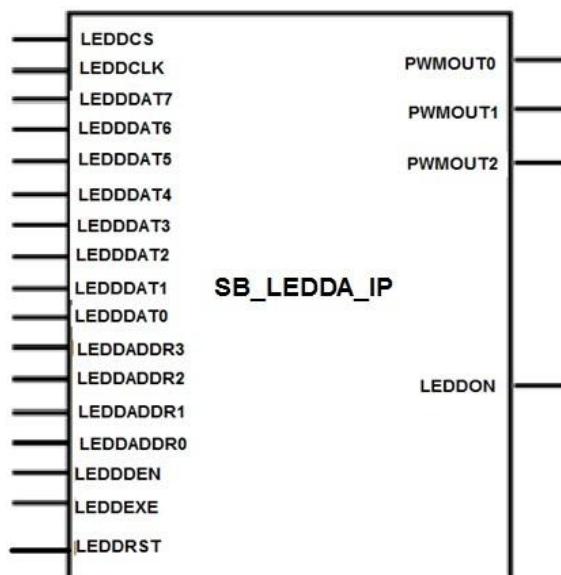

"0b111111111111"; = 500mA for Full Mode; 250mA for Half Mode.

## Verilog Instantiation

```
SB_IR500_DRV IRDRVinst (  
    .CURREN(ENABLE_CURRENT),  
    .IRLEDEN(ENABLE_IRDRV),  
    .IRPWM(IR_PWMINPUT),  
    .IRLED(IR_LEDOUT)  
);  
  
defparam IRDRVinst.CURRENT_MODE = "0b0";  
defparam IRDRVinst.IR500_CURRENT = "0b1111111111";
```

## SB\_LEDDA\_IP

SB\_LEDDA\_IP primitive generates the RGB PWM outputs for the RGB LED drivers. The IP contains registers that are programmed in by the SCI bus interface signals.

## Ports

SB_LEDDA_IP Ports		
Signal Name	Direction	Description
LEDDCS	Input	CS to write LEDD IP registers
LEDDCLK	Input	Clock to write LEDD IP registers
LEDDDAT7	Input	bit 7 data to write into the LEDD IP registers
LEDDDAT6	Input	bit 6 data to write into the LEDD IP registers
LEDDDAT5	Input	bit 5 data to write into the LEDD IP registers
LEDDDAT4	Input	bit 4 data to write into the LEDD IP registers
LEDDDAT3	Input	bit 3 data to write into the LEDD IP registers
LEDDDAT2	Input	bit 2 data to write into the LEDD IP registers
LEDDDAT1	Input	bit 1 data to write into the LEDD IP registers
LEDDDAT0	Input	bit 0 data to write into the LEDD IP registers
LEDDADDR3	Input	LEDD IP register address bit 3
LEDDADDR2	Input	LEDD IP register address bit 2
LEDDADDR1	Input	LEDD IP register address bit 1
LEDDADDR0	Input	LEDD IP register address bit 0
LEDDDEN	Input	Data enable input to indicate data and address are stable.
LEDDEXE	Input	Enable the IP to run the blinking sequence. When it is LOW, the sequence stops at the nearest OFF state.
LEDDRST	Input	Device level reset signal to reset all internal registers during the device configuration. This port is not accessible to user signals.
PWMOUT0	Output	PWM output 0
PWMOUT1	Output	PWM output 1
PWMOUT2	Output	PWM output 2

LEDDON	Output	Indicating the LED is on
--------	--------	--------------------------

## Default Signal Values

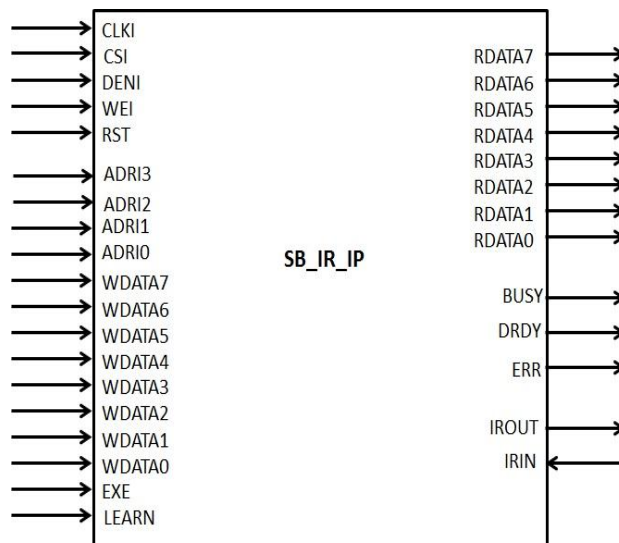

The iCEcube2 software assigns the logic “0” value to all unconnected input ports.

## Verilog Instantiation

```
SB_LEDDA_IP PWMgen_inst (
    .LEDDCS(led_cs),
    .LEDDCLK(led_clk),
    .LEDDDAT7(led_ip_data[7]),
    .LEDDDAT6(led_ip_data[6]),
    .LEDDDAT5(led_ip_data[5]),
    .LEDDDAT4(led_ip_data[4]),
    .LEDDDAT3(led_ip_data[3]),
    .LEDDDAT2(led_ip_data[2]),
    .LEDDDAT1(led_ip_data[1]),
    .LEDDDAT0(led_ip_data[0]),
    .LEDDADDR3(led_ip_addr[3]),
    .LEDDADDR2(led_ip_addr[2]),
    .LEDDADDR1(led_ip_addr[1]),
    .LEDDADDR0(led_ip_addr[0]),
    .LEDDDEN(led_ip_den),
    .LEDDEXE(led_ip_exe),
    .LEDDRST(led_ip_rst),
    .PWMOUT0(LED0),
    .PWMOUT1(LED1),
    .PWMOUT2(LED2),
    .LEDDON(led_on)
);
```

## SB\_IR\_IP

SB\_IR\_IP primitive is the IR transceiver module. It generates or receives the modulated pulse for the IR driver primitives.

## Ports

SB_IR_IP Ports		
Signal Name	Direction	Description
CLKI	Input	Clock input for IR IP
CSI	Input	Select Signal. Active High to activate the IP. This usually connects to the output of the decoding logic from MSB of the address bus
DENI	Input	Data Enable. When asserted, indicates that the data and address on the IR Transceiver Control Bus are stabilized and ready to be captured.
WEI	Input	Data Write Enable. Asserted during WRITE and de-asserted during READ cycle.
ADRI3	Input	Control Register Address Bit 3
ADRI2	Input	Control Register Address Bit 2
ADRI1	Input	Control Register Address Bit 1
ADRI0	Input	Control Register Address Bit 0
WDATA7	Input	Write Data Input Bit 7
WDATA6	Input	Write Data Input Bit 6
WDATA5	Input	Write Data Input Bit 5
WDATA4	Input	Write Data Input Bit 4
WDATA3	Input	Write Data Input Bit 3
WDATA2	Input	Write Data Input Bit 2
WDATA1	Input	Write Data Input Bit 1
WDATA0	Input	Write Data Input Bit 0
RDATA7	Output	Read Data Output Bit 7
RDATA6	Output	Read Data Output Bit 6
RDATA5	Output	Read Data Output Bit 5
RDATA4	Output	Read Data Output Bit 4
RDATA3	Output	Read Data Output Bit 3
RDATA2	Output	Read Data Output Bit 2
RDATA1	Output	Read Data Output Bit 1
RDATA0	Output	Read Data Output Bit 0
EXE	Input	Execute. when asserted, starts the IR Transceiver Hard IP to transmit or receive IR data
LEARN	Input	Learning Mode control. When asserted the IR Transceiver is in learning mode. The IR Transceiver will receive data instead of transmit data.
BUSY	Output	Busy status output
DRDY	Output	Data Buffer Ready status output
ERR	Output	Data Error status
RST	Input	Device level reset signal to reset all internal registers and IROUT signal to OFF state during the device configuration. This port is not accessible to user signals.
IRIN	Input	Modulated ON/OFF pulse from IR sensor.
IROUT	Output	Modulated ON/OFF pulse for IR Transmit.

## Default Signal Values

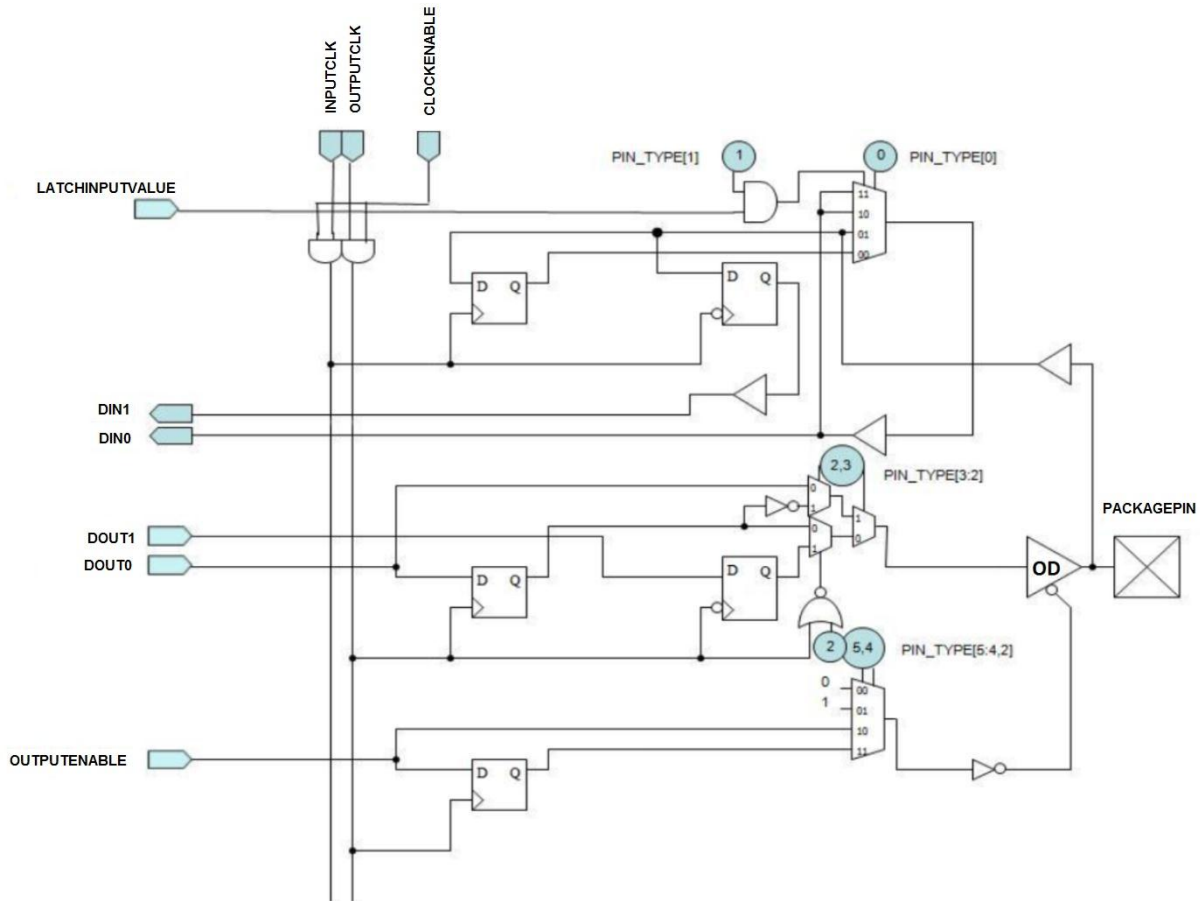

The iCEcube2 software assigns the logic “0” value to all unconnected input ports.

## Verilog Instantiation

```
SB_IR_IP IRIP_inst (  
    .CLKI(sysclk_i),  
    .CSI(csi_i),  
    .DENI(deni_i),  
    .WEI(wei_i),  
    .ADRI3(addri_i[3]),  
    .ADRI2(addri_i[2]),  
    .ADRI1(addri_i[1]),  
    .ADRI0(addri_i[0]),  
    .WDATA7(wdata_i[7]),  
    .WDATA6(wdata_i[6]),  
    .WDATA5(wdata_i[5]),  
    .WDATA4(wdata_i[4]),  
    .WDATA3(wdata_i[3]),  
    .WDATA2(wdata_i[2]),  
    .WDATA1(wdata_i[1]),  
    .WDATA0(wdata_i[0]),  
    .RDATA7(rdata_o[7]),  
    .RDATA6(rdata_o[6]),  
    .RDATA5(rdata_o[5]),  
    .RDATA4(rdata_o[4]),  
    .RDATA3(rdata_o[3]),  
    .RDATA2(rdata_o[2]),  
    .RDATA1(rdata_o[1]),  
    .RDATA0(rdata_o[0]),  
    .EXE(exe_i),  
    .LEARN(learn_i),  
    .BUSY(busy_o),  
    .DRDY(drdy_o),  
    .ERR(err_o),  
    .RST(rst_i),  
    .IRIN(irin_i),  
    .IROUT(irpulse_w)  
);
```

## SB\_IO\_OD

The SB\_IO\_OD is the open drain IO primitive. When the Tristate output is enabled, the IO pulls down the package pin signal to zero. The following figure and Verilog template illustrate the complete user accessible logic diagram, and its Verilog instantiation.

## Ports

SB_IO_OD Ports		
Signal Name	Direction	Description
PACKAGEPIN	Bidirectional	Bidirectional IO pin.
LATCHINPUTVALUE	Input	Latches/Holds the input data.
CLOCKENABLE	Input	Clock enable signal.
INPUTCLK	Input	Clock for the input registers.
OUTPUTCLK	Input	Clock for the output registers.
OUTPUTENABLE	Input	Enable Tristate output. Active high.
DOUT0	Input	Data to package pin.
DOUT1	Input	Data to package pin.
DIN0	Output	Data from package pin.
DIN1	Output	Data from package pin.

## Default Signal Values

The iCEcube2 software assigns the logic “0” value to all unconnected input ports except for CLOCKENABLE.

Note that explicitly connecting logic “1” value to port CLOCKENABLE will result in a non-optimal implementation, since extra LUT will be used to generate the Logic “1”. If the user’s intention is to keep the Input and Output registers always enabled, it is recommended that port CLOCKENABLE to be left unconnected.

## Parameter Values

```
Parameter PIN_TYPE = 6'b000000;  
                                // See Input and Output Pin Function Tables in SB_IO.  
                                // Default value of PIN_TYPE = 6'b000000  
Parameter NEG_TRIGGER = 1'b0;  
                                // Specify the polarity of all FFs in the I/O to be falling edge when  
                                NEG_TRIGGER = 1.    Default is 1'b0, rising edge.
```

## Input and Output Pin Function Tables

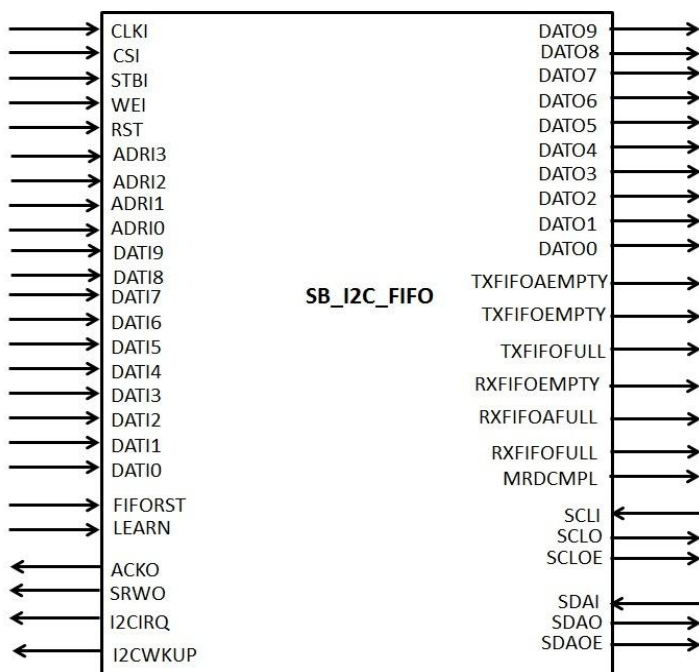

Refer SB\_IO Input and Output Pin Functional Table for the PIN\_TYPE settings. Some of the output pin configurations are not applicable for SB\_IO\_OD primitive.

## Verilog Instantiation

```
SB_IO_OD    OpenDrainInst0  
(  
    .PACKAGEPIN (PackagePin),           // User's Pin signal name  
    .LATCHINPUTVALUE (latchinputvalue), // Latches/holds the Input value  
    .CLOCKENABLE (clockenable),          // Clock Enable common to input and  
                                          // output clock  
    .INPUTCLK (inputclk),                // Clock for the input registers  
    .OUTPUTCLK (outputclk),              // Clock for the output registers  
    .OUTPUTENABLE (outputenable),        // Output Pin Tristate/Enable

## SB\_I2C\_FIFO

iCE40UL device supports two I2C hard IP primitives , located at bottom left corner and bottom right corner of the chip.

## Ports

SB_I2C_FIFO Ports		
Signal Name	Direction	Description
CLKI	Input	System Clock input
CSI	Input	Select Signal. Active High to activate the IP. This usually connects to the output of the decoding logic from MSB of the address bus
STBI	Input	Strobe Signal
WEI	Input	Write Enable Signal
ADRI3	Input	Control Register Address Bit 3
ADRI2	Input	Control Register Address Bit 2
ADRI1	Input	Control Register Address Bit 1
ADRI0	Input	Control Register Address Bit 0
DATI9	Input	Data Input Bit 9
DATI8	Input	Data Input Bit 8
DATI7	Input	Data Input Bit 7
DATI6	Input	Data Input Bit 6
DATI5	Input	Data Input Bit 5
DATI4	Input	Data Input Bit 4
DATI3	Input	Data Input Bit 3
DATI2	Input	Data Input Bit 2
DATI1	Input	Data Input Bit 1
DATI0	Input	Data Input Bit 0
DATO9	Output	Data Output Bit 9
DATO8	Output	Data Output Bit 8
DATO7	Output	Data Output Bit 7

DATO6	Output	Data Output Bit 6
DATO5	Output	Data Output Bit 5
DATO4	Output	Data Output Bit 4
DATO3	Output	Data Output Bit 3
DATO2	Output	Data Output Bit 2
DATO1	Output	Data Output Bit 1
DATO0	Output	Data Output Bit 0
ACKO	Output	Acknowledgement
I2CIRQ	Output	I2C Interrupt output
I2CWKUP	Output	I2C Wake up from Standby signal
SRWO	Output	Slave RW "1" master receiving / Slave transmitting "0" master transmitting / Slave receiving
SCLI	Input	Serial Clock Input
SCLO	Output	Serial Clock Output
SCLOE	Output	Serial Clock Output Enable. Active High
SDAI	Input	Serial Data Input
SDAO	Output	Serial Data Output
SDAOE	Output	Serial Data Output Enable. Active High
FIFORST <sup>1</sup>	Input	RESET for the FIFO logic
TXFIFOEMPTY <sup>1</sup>	Output	TX FIFO Status Signal
TXFIFOEMPTY <sup>1</sup>	Output	TX FIFO Status Signal
TXFIFOFULL <sup>1</sup>	Output	TX FIFO Status Signal
RXFIFOAFULL <sup>1</sup>	Output	RX FIFO Status Signal
RXFIFOFULL <sup>1</sup>	Output	RX FIFO Status Signal
RXFIFOEMPTY <sup>1</sup>	Output	RX FIFO Status Signal
MRDCMPL <sup>1</sup>	Output	Master Read Complete (only valid for Master Read Mode)

Note <sup>1</sup>: Only available if I2C\_FIFO\_ENB = ENABLED.

## Parameters

I2C Location	Parameters	Parameter Default	Description
Left Side Corner	I2C_SLAVE_ADDR	0b1111100001	Upper Bits <9:2> can be changed through control registers. Lower bits <1:0> are fixed.
Right Side	I2C_SLAVE_ADDR	0b1111100010	Upper Bits <9:2> can be changed through control registers. Lower bits <1:0> are fixed.

## Synthesis Attribute

### I2C\_CLK\_DIVIDER

Synthesis attribute "I2C\_CLK\_DIVIDER" is used by PNR and STA tools for optimization and deriving the appropriate clock frequency at SCLO output with respect to the SBCLKI input clock frequency.

/\* synthesis I2C\_CLK\_DIVIDER= Divide Value \*/  
Divide Value: 0, 1, 2, 3 ... 1023. Default is 0.

### SDA\_INPUT\_DELAYED

SDA\_INPUT\_DELAYED attribute is used to add 50ns additional delay to the SDAI signal.

/\* synthesis SDA\_INPUT\_DELAYED= value \*/

Value:

0: No delay.

1: Add 50ns delay. (Default value).

### **SDA\_OUTPUT\_DELAYED**

SDA\_OUTPUT\_DELAYED attribute is used to add 50ns additional delay to the SDAO signal.

```
/* synthesis SDA_OUTPUT_DELAYED= value */
```

Value:

0: No delay (Default value).

1: Add 50ns delay.

### **I2C\_FIFO\_ENB**

“I2C\_FIFO\_ENB” attribute is used to enable or disable FIFO

```
/* synthesis I2C_FIFO_ENB= [value] */
```

Value:

ENABLED : FIFO mode will be enabled.

DISABLED : FIFO mode will be disabled.

# Device Configuration Primitives

## **SB\_WARMBOOT**

iCE FPGA devices permit the user to load a different configuration image during regular operation. Through the use of the Warm Boot Primitive, the user can load one of 4 pre-defined configuration images into the iCE FPGA device.

*Note that this Warm Boot mode is different from the Cold Boot operation, which is executed during the initial device boot-up sequence.*

The selection of one of these 4 images is accomplished through 2 input signals, S1 and S0. In order to trigger the selection of a new image, an additional signal, BOOT, is provided. It should be noted that this signal is level-triggered, and should be used for every Warm Boot operation i.e. every time the user wishes to load a new image into the device.

The successful instantiation of this primitive also requires the user to specify the address locations of the 4 images. These addresses should be specified in the iCEcube2 software as per the Warm Boot Application Note.

## **Verilog Instantiation**

```
SB_WARMBOOT my_warmboot_i (
    .BOOT (my_boot),           // Level-sensitive trigger signal
    .S1 (my_sel1),             // S1, S0 specify selection of the
    .S0 (my_sel0)               // configuration image
);
```
